Hi Michael,

As I offered, feed at the bottom, and observe proper phase relationships. This page you reference also makes a note of those relationships being improper will point your radiation straight up, and straight down. Go figure - this is quickly revealed by EZNEC.

> When I applied RF to the center fed
>Lazy H four of my outside motion sensor flood lights would come on.

This is 100% rock-solid proof of Common Mode current on your transmission line. This condition will cause extreme grief in trying to match your transmitter to. It also skews the radiation/reception lobes BIG-TIME.

Does this sound familiar?

The problem probably comes from your tuner's BalUn having a connection to earth ground.

Solution to that (for all "balanced," horizontal antennas):
1. Use Coax.
2. Put a choke style (W2DU) BalUn at the antenna (ask about this).
3. Add a second choke a quarter wave away from the feed point.
OR
1. Fix the ground path inside your tuner (not as simple as it may seem, unfortunately - in fact it can be an Herculean task - it may not even be doable).
2. Obtain (purchase or build) the proper tuner.

Your antenna will then tune with vastly more grace, and you may even find it performs much like common sense would expect. As I said earlier, there is a world of experiential details that can kill an EZNEC model's prediction - and it isn't the fault of EZNEC.

I would go with a 2M QUAD, Very easy to build cookbook style. on site from scrounged materials. Ive used one from an apartment shooting through a balcony door. PVC mast was made from a couple of scrap pieces I got from the handy man. Pipe was selected so that one would slide inside the other. Apply padding to ends to protect ceiling and floor Think I wedged a piece of cardboard to lock the slip joint. Inovate as required. The quad can be asily put together with out benifit of test equipment and expected to function reasonably well without additinal tweaking. However a knockdown Yagi can be buit ahed of time and the elements stored inside the boom. Both are very handy.

I should probably invest in an antenna matcher.  Think I've got one for 11m,
but that wouldn't do me much good.  :-)

without additinal tweaking. However a knockdown Yagi can be buit ahed
of time and the elements stored inside the boom. Both are very handy.

Jimmie

Thanks, Jimmie. I was wondering about the quad, what kind of a pattern it
put out, etc. Gotta hit Google for some research.

On May 11, 3:09=A0pm, walt <w...@w2du.com> wrote:
> Cecil, you are correct!!!

Thanks Walt, it would be interesting to see what else about which I am correct. W7EL has a food-for-thought publication with one section about reflections from the source. His source has a 50 ohm source impedance, by design, so any dynamic load pulling experiment should result in zero reflections from the source. Question is, does it?

http://eznec.com/misc/Food_for_thought.pdf

The "forward and reverse power section" is at the bottom of the page.
Using the dynamic load pulling method, do the results always indicate
50 ohms for the source impedance no matter what is the load and/or the
transmission line length? If not, the method yields invalid results.

IMO, it is a gross error to presume that all redistribution of energy
is a result of reflections. In W7EL's example, there are no
reflections from the source yet it is obvious that energy is being
redistributed from the source back toward the load in some cases but
not in other cases. IMO, destructive/constructive interference must be
taken into account in order to explain the results. Yet, no one except
yours truly has even mentioned interference effects as a method of
redistributing energy.

Anyone interested in understanding the role of interference at
impedance discontinuities in transmission lines is welcome to read my
article at:

http://www.w5dxp.com/energy.htm

Right on, Cecil. The article you URL'ed is the most clear and accurate
paraphrasing of my presentation of the subject in 'Reflections'.
Nowhere else is the subject clearly defined concerning destructive and

constructive interference in relation to impedance matching and 100% re-reflection. I hope RF engineers everywhere can realize that optics and RF are indeed using the same principles of electromagnetics, and therefore follow exactly the same rules.

However, I would like for you to add one more reference to your article, an article I published in QEX that proves Steve Best's QEX three articles wrong. It appeared in the Jul/Aug 2004 issue, entitled, "A tutorial Dispelling Certain Misconceptions Concerning Wave Interference In Impedance Matching."

Let me know here whether you have a copy of my QEX article. If not, I'll email you a copy.

Walt, W2DU

If anyone else on this thread would like a copy of my QEX article please let me know by email. My email address is shown above.

Hello Cecil,

When a source behaves like a 50 Ohms source, it will not rereflect the reflected power back to the load. In other words the forward power generated by the source will not change when changing the load. The reflected power that is absorbed by the source may result in increase or reduction of power dissipation of the active device. It all depends on the change of the integral of V*I (for the active device).

With regards to load pulling, output impedance of an amplifier may change depending on the rate of change of the load. As I mentioned earlier, manual load pulling may result in change of supply and bias voltage and current. Average Voltage and current have time to settle to the new load condition.

In case of load pulling where the load changes relatively fast, but well within the matching section's bandwidth (as is the case for the off-carrier signal injection method) supply and bias voltage change may be less due to decoupling capacitance.

In simulation this can easily be seen by applying a load step change and observe the envelope and phase response versus time. Of course this requires you to model your power supply and bias circuit correctly. You may see a slow step response that cannot be explained by the bandwidth of the matching network.

To walt:
I didn=92t see your announced comment to my last post (regarding the forward/reverse power mathematics), did I missed it?

With kind regards,

Wim

Hello Wim,

I hadn't yet given you my final understanding of it. I understand the voltage divider action, but I don't yet understand the following quote from you:

"When terminated according to the numbers above the socket ("100W into 50 Ohms"), this results in 100W (Vout =3D 212.1*50/(50+100) =3D 70.7V, just a voltage divider consisting of 100 Ohms and 50 Ohms)."

The portion I don't understand is the mathematical basis for:

"(Vout =3D 212.1*50/(50+100) =3D 70.7V,"

And Wim, on your last post above I agree that if the source is 50 ohms with a real resistor, as in the classical generator used in text books. However, are you not aware that the output resistance of the RF power amp is R =3D E/R that appears at the output. Since this R is non-dissipative it re-reflects all the reflected power. I have proved this to be true in the experiment I presented with the Kenwood TS-830S presentation that I'm sure you have a copy of.

Consequently, the RF power amp is not going to absorb the reflected power.

At this point my email server is down, but I'll forward a copy of my QEX article ASAP.

Walt

Richard F is, of course, correct.  You can just as well do it for DC:
2V O.C., 1 ohm source will deliver 1A, 1V, 1 watt to a 1 ohm load.
For a 2 ohm load, the current is 2/3 amp; the power is 8/9 watt.  For
```

an 0.5 ohm load, the current is 4/3 amp; the power is 8/9 watt. It's
not terribly difficult to show, for the AC case, that the same is true
for any 2:1 load, regardless of phase angle--trivial, in fact, if you
accept that the SWR along a lossless TEM line is constant.

Cheers,
Tom

My apology, Wim, the equation I quoted in my last post is incorrect--I
mean't to say R =3D E/I, not E/R. Sorry.

Walt

Of course, with pretty much any decently designed power amplifier, no matter the frequency, included protection circuits will limit the dissipation and voltage in the critical areas (e.g., the output active devices). Loads become disconnected or shorted sometimes; winds blow stray wires or tree limbs across antennas. Through a piece of transmission line, such a change can reflect back to become any possible phase angle, and any of a very wide range of magnitudes, at the amplifier's output.

Though it's a red herring typical of audio-speak, most modern high fidelity audio amplifiers have a very low output impedance, a small fraction of an ohm, so they can claim a high damping factor. Off topic: the reason it's a red herring is that the impedance of the speaker connected to the amplifier must be included to figure the damping, and that impedance (even just the DC resistance of voice coils) changes by considerably more than the amplifier's output impedance (resistance) just because of heating on audio peaks.

Especially when reactive components (inductors and capacitors) couple power between a source and a load, you can get stresses--voltages and/or currents--well beyond what's safe when you try to operate the source into a load it's not intended to handle. That's true even when the net power delivered to the load is considerably LESS than the rated output power of the source. Wim's example of the class-E amplifier is true enough, but it's not necessary to ask the source to deliver more net load power than it's rated to deliver, to establish conditions that cause trouble. Thus, even sources that have an output impedance at or very close to the rated load impedance will have circuits to protect against loads that could destroy things inside the amplifier.

Cheers,
Tom

Hello Walt,

We have just a voltage source of 212Vrms with 100 Ohms in series. This is all in a black box and called my PA. That black box has a UHF socket and that mentions "100 W into 50 Ohms".

When you connect 50 Ohms to the SO 239 socket, you get a voltage divider. 2/3 of the EMF is across the internal 100 Ohms and 1/3 is across the 50 Ohms load. This results in 70.7V across the load (so 100W).

Does this make sense?

Wim
PA3DJS

Hello Tom,

I agree with your statement. If you have a CLC LPF section that
introduces about 90 degrees phase delay (see it as a quarter wave
section) and it looks into an open load (so zero power is delivered
to this open load), this will result in a low impedance at the input
of the CLC network. If the plate is connected at this CLC network,
the plate's dissipation will greatly increase.

I also fully agree on this one.

I'm going to slip a mickey into this by a careful, editorial change of
focus BACK to the subject line.

Though it's a red herring typical of Ham-speak, most modern retail
100W RF transmitters for amateur service have a very low output
impedance, a fraction of an ohm [editorial: until, of course, it goes
to the Z transformer that precedes the bandpass filter].

It must be a rare condition for which there is a transition frequency
below which audio amps source rated at sub Ohm Z feeding loads up to
10 times the sub-Ohm design work - and above which retail Amateur
transmitters at loads up to 10 times the sub-Ohm design do not work
[editorial: without that Z transformer]. Curious logic.

I wonder if that works (sic) backwards? Would the RF deck's finals
feed a speaker with audio with equal power performance of the Audio
amp? Both are sub-Ohm sources, and the RF deck certainly has the
bandwidth.

I await the specification of this transition frequency and the
analysis of how the 100W RF final deck would fail to supply 100W audio
(however crummy it may sound).

Any problems that might arise for the retail Ham transmitter are
already handled by protection circuitry so that's a wash.

73's

The signal injection is just a way of emulating a non 50 Ohm
termination where you need to change load and or cable length. By
using slightly off-carrier frequency, you emulate a changing phase of

reflection coefficient. That emulated reflected signal goes to the PA and interferes with the forward signal (produced by the PA). That interference is required as this modifies current and voltage at the PA's active device.

To be honest, I, and my ham friends, never had to use photon theory to solve problems in both amateur and professional RF-Engineering. So I think this doesn=92t contribute to the discussion.

> You guys are presuming that reflections are the only thing you are

Worth to try yourself:

1. Set up a simple linear circuit in simulation (for example AC voltage source some impedance in series). You can use whatever (free) program you like. Use a program that allows transient (non-linear) simulation as you are working with two frequencies at the same time. I used Beige Bag spice A/D professional version 4 (not free)

2. Determine the output impedance via load pulling (for various loads if you like)

3. Do the same with the "VNA" setup (with the PA producing RF output). You need to observe the envelope variations or you have to insert a narrow band filter to suppress the carrier. I prefer observing the sinusoidally changing envelope   (as this shows distortion immediately (intermod products) and saves me the settling time for the filters).

In simulation you have ideal current meters, so if you use voltage and current directly (and drop the directional couplers) you can skip the conversion from reflection coefficient to impedance.

Here you will see that the output impedance is independent of VSWR (as we started with a linear circuit) and both methods give same results.

If you like, you could now implement a real PA in simulation and do the simulation again. Note that tuning the amplifier in simulation is (very) time consuming. You will notice that, depending on the amplifier you implemented, impedance will change with increasing VSWR presented to the amplifier (valid for both methods).

I did all the above with various circuits to prove the fitness of the method. For some circuits there was a difference in result. After evaluation, that difference was caused by changes in (bias) supply during "manual" load pulling (that initially did not happen during the slightly off-carrier signal injection). With stiff bias conditions, the difference disappeared to within the accuracy limits.

Knowing that EM RF waves must necessarily obey the laws of photon
physics can save one from all sorts of technical blunders. But feel
free to blunder on.

Hello Cecil,

Maybe you should change your attitude from "it is wrong" to "it may be true". This might open your mind to study other insights.

When measuring an RF current in a PA, everybody ignores the quantisation of charge. Is this lack of knowledge?

The frequency of our waves is sufficiently low to ignore any quantisation effects due to photons. Is this lack of knowledge? In my opinion a good Engineer knows what he can ignore and what not to efficiently solve a certain task.

Starting a discussion about photons, in my opinion, is a way to reduce the S/N ratio of the discussion.

With kind regards,

Wim

When an s11 measurement is wrong by an infinite percentage, I cannot
see how it could possibly be "true" - sorry.

Don Hubbard was my best friend and that was one of his pet sayings. I assume he meant it was better to have bad breath than to be an SK, which he is.

I think most of the discussion is ignoring lots of things... first of all you must answer the question; Does it really matter? If it does, then i will assume that you are a designer and know how to apply the tube characteristics to come up with a design that matches your selected tube to the expected load... but does that process really ever describe the 'output impedance'?? Then you must also consider the tuning parameters employed... sure, you can measure the output impedance at a given operating point, but answer the question again; Does it really matter? Or do you need to measure it over a wide range of operating conditions? Every operator i have seen tune up one of my amps has done it a little bit different... heck, i don't even do it exactly the same twice in a row i bet. So when i am running an amp into a switchable set of 7 different antenna combinations on a given band, can tune from one end of the band to the other without touching the settings, and can make an infinite number of small adjustments to the drive, tune, and load settings, and on some bands can tweak a tuner after the amp to 'make it happier', do I really care what the 'output impedance' really is? As long as the matching network provides adequate adjustment so i can get out the desired power into my various loads while keeping the tubes within their operating limits, do i really care what the 'output impedance' really is at any one set of conditions that i may never exactly duplicate again? I think not. So this boils down to an academic discussion, and as in many cases where no one has, or can, make an exact statement of the problem the specific answer remains elusive.   So consider this, until you have a complete statement of the problem you will never be able to derive a value that any two of you will agree on, let alone actually try to set up a measurement of.

Hi, Wim -

I believe his confusion is the one-port vs two-port problem. I don't have a problem with your explanation. But, I think he is throwing in a port where he should not.

Cheers,
John

When one's basic premises violate the laws of physics, it is very
difficult to come up with a valid answer.

The second port is actually there on the other side of the black box,
but it has been overlooked. Doesn't it give anyone pause to realize
that the s11 parameter changes by an infinite percentage depending
upon whether it is measured as a one-port system or as a two-port
system? If that can happen with a passive black box, consider how much
more complicated it might be with an RF source included in the black
box.

No, the antenna still has the same characteristics. You changed the impedance at a point remote from the antenna.

> While this is hardly news, it got me wondering whether a 75-ohm cable
> will load the transmitter the same. Doesn't seem like it.

It depends on a number of factors. For example, use a .5 wavelength 75 ohm cable to feed a 50 ohm resistance. Your transmitter happily thinks it is 50 ohms. Because it is.

> My point: Using 75-ohm cable to improve the match at the antenna

>
> "Sal"
> (KD6VKW)

Transmitters don't have a clearly defined output impedance and, whatever output impedance is there, doesn't necessarily mean anything.

Your main concern is to provide a 50 ohm load for the transmitter to see.

Actually, it the feed line and load are both 75 ohms, you will only see a 1.5:1 SWR. Don't worry about it.

Cheers,
John

No. The experiment is designed as a one-port experiment. You have broken the law and must go to jail without passing GO.

Hello Dave and John,

When you look to my first posting to this thread, you may conclude
that I agree with you.

We had such a discussion about a year ago where I stated that most RF
amplifiers do not have 50 Ohms output impedance. That statement was
heavily disputed by some persons. I tried to support that statement
with simulations, but without any success.

Regarding the "academic discussion" I also agree. In my professional
career where I designed several RF PA's, only 2 times the output
impedance of the amplifier was of importance. In one of these cases I
couldn't meet the specs and had to insert attenuation (some waste of
power=85).

The thing I don't like is that some people criticize methods used by some of the group members without a solid foundation.

Regarding the two-port single-port issue. One can setup a reasoning based on a two-port setup, but that significantly complicates the matter without giving any additional insight. I tried to keep it simple by referencing to a VSWR measurement (with an antenna analyzer) of an antenna when a strong transmitter is nearby, but it seems I wasn't clear enough for all people following this thread.

With kind regards,

Wim

What a strange ellipsis.

In other words if this statement bears upon the discussion, then it
deserves a fuller context. Why was it of importance?

> In one of these cases I
>couldn't meet the specs and had to insert attenuation (some waste of

Ed McMahon: "How much power?"

Just trying to get some perspective on this power sourced in the PA.

"Everything should be made as simple as possible, but not simpler."
Albert Einstein

Here's my earlier example:

Source-----Z0=3D50----x----1/4WL Z0=3D100----200 ohm load

s11 is measured at point x equal to 0.3333 and also 0.3333 at the load. Nowhere is s11 equal to 0.0000. Put everything to the right of point x into a black box and s11 measures to be 0.0000 under exactly the same conditions??? And you guys want all of us to trust that measurement enough to predict the disputed source impedance of an RF amp when it cannot even predict the load impedance in the above very simple passive circuit?

There are reflected waves at point x (s11*a1) that are equal in magnitude and 180 degrees out of phase with the reflected waves transmitted back from the load (s12*a2). The two waves undergo destructive interference at point x which creates a V/I ratio of 50 at point x. But the absence of *net* reflected energy at point x does not mean that there are no reflections at point x. There are actually two sets of reflections at point x that mask any attempt to determine the actual value of the load impedance by measuring s11 when the system is installed inside a black box. It is foolish to presume that there are no similar interference patterns inside an RF amp. In fact, the only condition where there is no interference inside a simple voltage source is when there are no reflections or the reflections are orthogonal to the source signal.

There is a good discussion of the role of interference in the creation of virtual impedances in section 4.3 of "Reflections", by Walter Maxwell. Even though a lot RF engineers scoff at the laws of EM wave physics from the field of optics, the best explanation of interference I have ever read is the chapter by the same name in "Optics", by Hecht. Another good chapter in "Optics" is "The Superposition of Waves".

Hello Cecil,

Basically, it doesn't matter what is inside the box. It can be fully characterized by its impedance versus frequency (small signal approach).

I am fully aware of that there are (back and forth) reflections in the quarter wave line inside the black box. However in case of a black box, you don't know that (black box principle).

Same thing happens in most narrow band antennas. The antenna wire itself may be subjected to (for example) VSWR =3D 10, though the impedance can be 50 Ohm (and therefore doesn=92t introduce reflection in a 50 Ohms feed line). I know that this 50 Ohms is the result of interfering waves/signals, but an MFJ 259B antenna analyzer, or my FT7B doesn't (and doesn't need to know it).

One could only guess what is a black box based on its impedance versus frequency curve, S11 curve or Time domain response (I had to do this in school).

So if we decide to open the black box and we put the reference plane inside the box, we get a new thread, something like: "why has a PA certain output impedance?", or "what is the large signal output impedance of valves, BJT, FET, etc?".

With kind regards,

Wim

actually, to provide an *acceptable* load for the transmitter that maximizes radiated RF power. That might not be 50 ohms.. and I don't know that we actually care what it is, unless we're designing amplifiers.

50 ohms is basically a "standard test condition" so that you can compare amplifiers, and it happens to be convenient that everything is made with the same standard impedance. That way, your test load (which will dissipate a fair amount of power in some tests) can be located somewhere different, and connected by a length of transmission line with the same impedance, so the test at the amplifier output reference plane is still valid.

On May 4, 10:47=A0am, Wimpie <wimabc...@tetech.nl> wrote:

> Basically, it doesn't matter what is inside the box. It can be fully characterized by its impedance versus frequency (small signal approach).

If what is inside the box doesn't matter, why waste time trying to measure what is inside the RF amp box? What can be "fully characterized" is the box's relationship to everything outside of the box. Exactly what is inside the box cannot be ascertained at all while we handicap ourselves with a blinders. When we actually look inside an RF amp, we find active non-linear devices upon which we all have been warned about trying to use linear assumptions.

It doesn't matter what is inside the box when *conditions outside of the box* are being considered. EE201. What is inside the box matters considerably for *conditions inside the box*. For instance, replacing a 50 ohm dipole with a 50 ohm lumped circuit doesn't change things between the load and the source. But it causes an almost infinite change from the load out to the rest of reality.

Anything else I could say on this subject would be repetition.

During 1991 Warren Bruene used the RPG method in which he believes he measured the source resistance of an RF power amp, which he calls 'Rs'. I have never agreed that his method measures the source impedance, or that his data has any relevance to anything.

Consequently, I am not impressed with the discussion going on here concerning applying a signal back into an operating RF power amp to determine the source impedance. Please define 'source impedance'-- where is it located in the amp? At the plate? At the output of the pi-network?. And how do you know the data obtained using this method is correct? Have you verified it by comparing it with data obtained using another method?

I made a statement in an earlier post that when measuring the output impedance using the 'load pull' method we're not concerned with the absolute maximum power that can be delivered, but instead, limiting the 'maximum' power delivered to that which can be delivered with a specific level of grid drive, one which allows the power to be limited to that of a normal operating level. Tom disagrees with this position, that it is really the ABSOLUTE MAXIMUM power delivery that should be considered. As you can see, I don't agree with Tom.

I don't know how many on this thread have actually reviewed the portion of my Chapter 19 that presents the step-by-step procedure I used in determining the output impedance of the Kenwood TS-830S tx, which shows precisely the output impedance appearing at the output of the pi-network.

To summarize the procedure that I maintain will provide an accurate measurement of the output impedance appearing at the output terminals of the pi-network is as follows:

1) Adjust the loading and tuning controls of the amp to deliver all the available power to a complex load in the amount normally used in operation with the setting of the grid-drive level required to obtain that output power.

2).Measure the impedance of the complex load.

3) The output impedance, or 'source' impedance of the amp appearing at the output terminals of the pi-network is the complex conjugate of the load impedance.

Now, when you measure the source impedance using the externally-injected signal, does the data from that measurement agree with that of the load-measuring method? If it does, then I'll agree that the RPG method is valid. If it doesn't I'll continue to have considerable doubt as to its validity. But I'd still like to know where the resistance measured by this method is located in the amp.

Walt

It seems to me that we maybe should not be talking about source impedance but maybe about 'regulation' or some other equivalent word.

For an open-loop source made from real components, I think one will always find that there is a dE/dI number for output loading that we can call source resistance.

It does not always mean that there is a physical resistance in the

circuit. It is simply a measure of the ability of the device to provide
an unvarying voltage under conditions of varying load.

Does this make any sense?

John

If it does, then I'll agree that the RPG method is valid. If it doesn't I'll continue to have considerable doubt as to its validity. But I'd still like to know where the resistance measured by this method is located in the amp.
>
> Walt

Hello Walt,

Except for bias or supply voltage change due to load change, load pulling does give similar results as off-carrier signal injection.   I did this in simulation for various circuits (linear and non-linear). You may remember that I put something in a document (discussion of last year, it is still on my website).

You can get different results in case of soft power supply or bias supplies. In case of manual load pulling, bias/supply voltage may change (think of change in grid current due to change in RF plate voltage). There is sufficient time for all voltages and currents to settle.   I added a section on the envelope response due to bias current/voltage change.

When you use the injection method (for example with 130 Hz offset), it is like load pulling where you switch the load 200 times/s (more specifically you rotate the phase of the reflection coefficient as seen by the PA). In such a situation bias and supply voltages will settle to an average value resulting in (slightly) different results.

While not relevant for here, but nice to mention, stiffness of bias supplies has influence on IMD also.

With kind regards,

Wim

Hello John,

You are correct with respect to the physical resistor. If you tune a real class-C amplifier for maximum output power (conjugated match), you may not reach the highest efficiency, but at least significantly above 60%. So this shows that there is no "physical" 50 Ohms in the PA (assuming 50 Ohms load). If so, the efficiency would never exceed 50%.

When you change the load (after tuning for maximum output) from 50 Ohms to (for example) 30 Ohms and would carry out an impedance measurement around that 30 Ohms load resistance, you will measure something completely different. With "around 30 Ohms" I mean using 32 and 28 Ohms (for example).

With kind regards,

Wim

Acceptable is what the manufacturer recommends for his gear. What does
this have to do with the device's output impedance?

John

Absolutely nothing.. which is the point.   Manufacturers have to make their device work into some sort of loads, but can't test every possible load, nor necessarily optimize the design for every possible load that someone might use.

So we use, as a convention, that we'll measure the output power or DC to RF conversion efficiency or Power Added Efficiency or whatever, with a 50 ohm resistive load hooked up to it.

That doesn't mean that we actually want to use a 50 ohm load in real life. Maybe I have an amplifier designed to drive a loop antenna with a resistive 10 ohm impedance. I might optimize it for that, but, because people want to see a spec sheet, I'm going to have to measure the output into 50 ohms and put that on the data sheet.

Or, perhaps, the active devices I use happen to have a "natural" output

impedance of, say, 8-10 ohms, so I put a 4:1 transformer on the output.
My box, if I were to measure the output Z, would show about 40 ohms. I'd test it with a 50 ohm load, make sure I could put out 100W into that load so I can sell it as a "100 W transmitter" and be done with it.

It might happen that you could hook up a 40 ohm load, or a 20 ohm load, and it will work just fine, and may even put out more than 100W.

The fact of the matter is that ham manufacturers don't actually specify the output Z: they just give you a range of outputs into which they'll guarantee the transmitter won't fail. (e.g. say, 25 to 100 ohms.. perhaps specified a bit sloppily as VSWR 2:1 if driven from a 50 ohm source)

Interestingly, my IC7000 manual doesn't even give a output impedance, or even a range of legal load impedances (page 150 of the manual).

Page 11 does say "Antenna Connector: Accepts a 50 ohm antenna with a PL-259 connector"

And Page 15 does say "Use a well matched 50ohm antenna" and "An SWR of 1.5:1 or lower is recommended" doesn't say it won't work, doesn't even say it only develops rated output power (on page 150) into that particular load. There is a boxed note that says that if the SWR is higher than approx 2.0:1, the transceiver's output power is reduced.

And, let's look at the service manual.. Spec page is identical to the one in the user manual. The procedure calls out a whole bunch of adjustments to set the "% power" to appropriate levels using a 50 ohm load, but doesn't say what the power into some other load Z would be.

There is a test that when you hook up 100 ohms, the internal SWR meter reads 2:1, and 50 ohms reads 1:1. But that's not a test of the transmitter's output Z, more a calibration of the transmitter as RF ohmmeter for an external component.

The ALC system actually measures the output VOLTAGE (not power) and matches that up against the setpoint for the power (implying that if you hook up a 40 ohm load, and you set the radio for 50W, you'll get a bit more out).

the Automatic Power Limiting is a current sensor: if it exceeds 22A, it reduces the drive. In fact, it kind of looks like the reflected HF power (from the sampler at the filter output) isn't used to control the drive at all.. it's just used to drive the SWR indicator. Kind of tough to tell, the prose description is a bit unclear, and I haven't followed all the signals through on the schematic.

but the summary is,

This is comparable to the concept of "dynamic resistance" and, as well, to "negative resistance" (as exhibited by gas discharges for instance).

The local slope of the V/I curve is negative, but that doesn't mean that it has negative power.

Interesting. For a community that is so tight-fisted with cash, and so brag-hearty with power claims, absolutely no one has ever tossed their hat into the ring that with lower than 50Ohm termination on their rig (and I'm not talking about 45Ohms) or with a more than 50Ohm termination on their rig (and this is certainly achievable with a 72Ohm Dipole and 70 Ohm coax) that they have then proclaimed they

substantially exceeded 100W radiated (or lost to heat for that matter)
by the same degree of offset from 50.

>Or, perhaps, the active devices I use happen to have a "natural" output
>impedance of, say, 8-10 ohms,

That must date to the 1950s vintage of solid state. Your own IC7000
certainly doesn't suffer that abysmal "natural" output impedance. The
RD70HHF1 for 97W into 50Ohms exhibits 0.77-j0.22 Ohms @ 30MHz, a far
cry from your supposition. Off by 1000%?

>It might happen that you could hook up a 40 ohm load, or a 20 ohm load,
>and it will work just fine, and may even put out more than 100W.

"May" is lazy, "Does" is more authoritative. Any reports of "Does?"

>And Page 15 does say "Use a well matched 50ohm antenna" and "An SWR of
>1.5:1 or lower is recommended" doesn't say it won't work, doesn't even
>say it only develops rated output power (on page 150) into that

>higher than approx 2.0:1, the transceiver's output power is reduced.

Which is curious when the manufacturer of the RD70HHF1 power
transistors gives them a "No destroy" rating into a mismatch of 20:1.
Such is the inertia of 1950s design-think with modern components.

Dear Wimpie: The content of the paragraph below may well rise above the noise of this thread.
I expect to learn something of value from your comments about why twice the (apparent) output Z of an amplifier was of importance and what you did to have the amplifiers conform.

73,   Mac   N8TT

"Wimpie" wrote in message
news:d68fc390-da1b-45c7-8f2a-eda684959d03@u16g2000yqj.googlegroups.com...

Hello Dave and John,

<snip>

Regarding the "academic discussion" I also agree. In my professional career where I designed several RF PA's, only 2 times the output impedance of the amplifier was of importance. In one of these cases I couldn't meet the specs and had to insert attenuation (some waste of power�).

<snip>

With kind regards,

Wim

Maybe that's because of tradition.. it's not only hams who do that. In the professional world, there's a strong tendency to make the "interfaces" between subsystems 50 ohms, even if overall system efficiency might be improved by, say, a 25 ohm impedance. I've worked on systems where a DAC produced a balanced signal with a 200 ohm Z, and the vector modulator at the other end had a balanced input with a 200 ohm Z, but everyone insisted we put a 4:1 transformer on each end, so we could run 50 ohm coax for a <10cm run.

If you're a amp maker, you're probably going to sell a lot more amps if you specify and design for 50 ohms (the 10 ohm PA for loop antennas would be a niche market). Likewise, if you're an antenna builder, designing a product for 50 ohms will sell more than, say, 35 ohms.

In the cellphone world, because the PA and antenna tend to be developed as an integrated assembly, they're probably a bit more flexible on this.

There's also the issue of wanting to put a power meter in line (but I think that if you're using a 10 ohm system, you're probably capable of figuring out how to measure power to make sure that you're not busting the FCC limits)

>

Just an example. I know that modern parts are MUCH lower. The point is that if one knew you had a 3 ohm load, you could design an amplifier that would directly drive it without a transformer or network, and potentially get better overall efficiency.

The link from several days ago for the gentleman who measured the output
Z being around 40 ohms would be a "does"..

Yes, but the design limit might not be the transistor mismatch. It
might be a thermal dissipation limit, or some other component that's the
limiting factor.

(Or even, a desire to not have to answer 1000 customer service inquiries
to explain why it really doesn't matter what you hook up, or to explain,
that, yes, you DO need to actually connect an antenna of some sort)

Amateur radio, particularly in the mass market, is pretty slow to move.

Exactly..

In fact, as interesting as it would be to measure the output impedance
of my radio, I started to think about what it would buy me, and came to
the conclusion, almost nothing (other than satisfying curiosity).

It *might* be interesting to look at (and write an article for QST/QEX
or something) "optimizing radiated power".  Answering the question: do
you really want a 50 ohm match on your antenna analyzer, or do you want
maximum net power at the antenna feedpoint, and what that might mean for
typical 100W solid state rigs, antennas, etc.

(as a practical matter, this is what automatic antenna tuners actually
adjust for: either minimum reflected power, or maximum fwd-ref)

but it's possible that deliberately running a mismatch (as shown on your
rig's SWR meter) might actually result in more radiated power.  e.g. if
at 1:1 you have 100W fwd and 0 rev, but at 2:1 you have 150W fwd and 15W
reflected, so you're actually net 135W vs 100W; assuming your rig
doesn't otherwise have any problems.

Strangely enough, for any fixed configuration with reflections, one
way to maximize radiated power is to maximize reflected power at the
antenna feedpoint.:)

Well, that and the rest doesn't respond to the observation that NO ONE
makes a claim of more power from a rig that DOES NOT have a source
resistance of 50 Ohm.

>in the professional world, there's a strong tendency to make the
>"interfaces" between subsystems 50 ohms, even if overall system

Retail engineering is ruled by a market economy. You have offered a
reductio-ad-absurdum of the native components offering ~10 Ohms
without the cost of intervening transformers. Such an "improved
efficiency" at lower cost option has been available for decades and
has yet to appear as a retail product for the tight-fisted Ham market.
Market logic shows by the force of economy that such a solution is not
viable.

>>a far cry from your supposition. Off by 1000%?

An incredibly poor one in the context of 100W transmitters when garden variety examples abound.

>I know that modern parts are MUCH lower.

That deliver 97W into 50 Ohms at 30 MHZ with a nominal 12VDC supply? I
smell another poor example.

>>> It might happen that you could hook up a 40 ohm load, or a 20 ohm load,

"Does" with how much more power? When I observe the contents of the
page at that link = NOT ONE WATT MORE!

In fact, if we follow the logic of lowered Rs yielding more power, his
own data flips this! He reports the same 100W available at higher Rs.

However, all that aside, when you observe your comment above, the link
"Does not" offer any support to it. In fact on9cvd explicitly offers:
     "This is an ambiguous message"

>> Which is curious when the manufacturer of the RD70HHF1 power
>> transistors gives them a "No destroy" rating into a mismatch of 20:1.

Consult the original spec. It is quite specific. The characteristic
of
    Load VSWR tolerance: Load VSWR=20:1(All Phase): No destroy
is not a dissipation reference.

I need an NMO mount for a rather long antenna that would put a lot of
strain on the sheet metal of the roof of my van.  Underneath the sheet
metal I can use a fender washer.  On top I need a mount with a larger
base area and the NMO mount on top of that.  It might look like a
smallish mag mount but without the cable showing because that would
come from inside through the hole.  If anyone knows of a manufacturer
that makes such a mount please pass the name along.  I've tried
several searches but without being able to guess what order the words
would be in I get nowhere.  Any tips would be appreciated.

Hello,

Regarding the defined output impedance.

The first time was during my thesis (third harmonic peaking PA). The stability margin was not very large (expected), and it could be improved by keeping the impedance seen from the base within certain limits. My teacher said, be careful, you only have two devices (BLW76). I tried to make an exciter (based on 2SC1307 BJT) with defined output impedance, but without success. So in the end I increased the output power of the exciter and inserted a 3 dB attenuator, not elegant, but it did the job.

The second time was for H-field generation where wider bandwidth was achieved by adding a second resonator. When driving from a 50 Ohms source, it had a nice Chebyshev type pass band. Because of the ripple, it shows reflection in the pass band (this happens with Chebyshev response). However when driving from a PA (that was flat within the pass band when loaded with 50 Ohms), everything went wrong.

I redesigned the filter/coil combination, designed a switching PA (half bridge in class DE operation) and skipped the 50 Ohms (I designed around 8 Ohms). The PA drives the filter directly in such away that most of the time the PA sees a nice (mismatched) load (that is inductive for harmonics). This resulted in the desired pass band with significantly increased efficiency. The strength of the H-field is controlled by varying the supply voltage (PWM circuit).

Leaving out the 50 Ohms in between, saved several capacitors and inductors.

With kind regards,

Wim

Hey Mac, are you planning on attending the Chapter 10 QCWA meeting in
Cadillac Saturday? I'm planning on attending, so hope to see you
there!!!

Walt, W2DU

Hello Jim,

I agree with the PA load mismatch issue. It is possible to get (some)
more net power by applying mismatch to a PA stage (from experience).
But frequently it comes with too much increase in input power (so very
hot heatsink).

In case of high efficiency designs, the active devices may communicate
to you by means of smoke or ejection of (hot) particles.

Wim

What about using epoxy (or brazing) to mount a NMO on a larger piece of metal.

  It might look like a

Hi Wimpie and KD5YI,

Will you please explain how it is possible to get more power delivered
by applying a mismatch to the output of a PA?

And for KD5YI specifically, I believe you have presented some inaccurate math calculations. You begin with delivering 100w into a matched load. Then you say you mismatch to 2:1 and get 135w forward and 15w reflected, leaving 120w delivered. You must be kidding!!

First, with a 2:1 mismatch and 100w delivered by the PA, the reflected power is 11.111w, which when added to 100w from the source, the forward power is 111.11 watts. When the reflected power that returns to the load is subtracted from the forward power, the result is 100w. You've heard the expression 'there is no free lunch'?

So please explain to me, if you can, how you can deliver 120w when the source is 100w.

Walt

Ooops, my error, you said you're getting 130w delivered, not 120w as I
said incorrectly.

Walt

No he is not kidding. I observed the same. At that time I was lucky to have full access to HP, Advantest and Rohde & Schwarz equipment to double-check everything (I first blamed my own gear). You should leave the idea that all PA's have 50 Ohms output impedance, then it is easy to explain yourself.

A certain load that has mismatch referenced to 50 Ohms may have a nice match to a system with non-50 Ohms output impedance.

The extreme cases where you can get significantly more net output power by applying mismatch, are PA's with high efficiency (class-E, -D, -DE, etc). I am currently designing a balanced class-E 500W stage. It can deliver 1 kW, but within very short time the mosfet's will explode (if the supervisory circuit doesn't act).

Wim, are you saying that by using Class E amps you are able to violate the Laws of Physics pertaining to the Conjugate Matching Theorem and the Maximum Power Delivery Theorem? I cannot agree.

A load doesn't care what the source is. If the load impedance is the complex conjugate of the source, all available power will be delivered to the load. Then, if the load impedance is either increased or decreased, the power delivered will decrease. Are you now saying that the concept I just stated above is no longer true? If you are, please explain in detail why this is so. How does 'high efficiency' overcome the requirement for impedance matching in the delivery of power?

And are you agreeing with an earlier poster that with a 100w source and a mismatch of 2:1 the forward power will be 135w and 15w reflected, the power delivered to the load will be 130w? If so, will you please explain in detail how this can occur?

Walt

Walt, Maybe you should familiarize yourself with class E (and other
high efficient topologies). Set up a simulation (or measurement) and
try to apply your "conjugated match" thing. You will find out that you
can't make a class E PA that operates under conjugated match, unless
you are going to play with the power supply's internal resistance (so
the system becomes power supply limited). My current design outputs
500W into 4.5 Ohms, however the output impedance (load pulling) is < 1
Ohm.

The reason for non-conjugated matched operation is that in class-E the
device is in voltage saturation for about 50% of the time. During that
time the device has no gain, so a device used in class-E has less gain
then the same device used in a non-saturated application. In other
words: tuning is designed for highest efficiency, not highest output
power.

>

Quote from text above: "If the load impedance is the complex conjugate

of the source.....". This If-statement has a "false" result for many
PAs, try to broaden your view.

> Then, if the load impedance is either increased or
> decreased, the power delivered will decrease. Are you now saying that

> you please explain in detail how this can occur?

Yes I agree with him, see my reaction to that statement

My class-E PA design that I am doing now is designed for a 4.5 Ohms
nominal load. If I change that load to 2.5 Ohms (VSWR=3D1.8), output
increases to > 700W, but it will be destroyed due too non-favourite
combination of Vds and Id.

> Walt

With kind regards,

Wim

As I understand it, Walt's approach is to pick a point inside the source at which the output becomes linear through filtering and call the impedance at that point the linear "source impedance" (including some boundary conditions). It is akin to the motion of a pendulum in a clock being linear even though the sustaining energy comes in non-linear pulses.

Well, Wim, I still don't see how a 2:1 mismatch can achieve 135w
forward and 15w reflected with a 100w source. How can a 2:1 mismatch
achieve 130w forward power, when that mismatch can only reflect 0.111
x 100w? Also, how can that mismatch achieve 15w of reflected power
when that mismatch can only reflect 0.111 x 100w? And how can 11.111

watts of forward power add to 100w to achieve 130w? I don't see how the power reflected at a mismatched load can be affected by the nature of the source.

But I do understand how with a 4.5-ohm load can deliver 500w and a 2.5-ohm load can deliver 700w. I now understand what you mean by a mismatch can increase the power delivery. (Actually, a change in mismatch)

But Wim, you pulled a fast one one us!!! Until now you didn't tell us that the source resistance of the source was 1 ohm!!!

You also didn't tell us what the power would be if the load was 1 ohm (thus matching the load to the source) if the power supply was sufficiently large so the power delivery would not be limited by the power supply. So in reality, you really DON'T get an increase in power delivery by mismatching, but actually a decrease. What you're really doing is obtaining an increase in power delivery by decreasing the amount of mismatch from 4.5:1 to 2.5:1.

So now I understand that you haven't violated any laws of physics, but IMHO, you have been misleading when you say you obtain a increase in power by mismatching, because that statement isn't really true, is it?

take care,

Walt

Hello Walt,

Off course I agree with you that you can never have more power then
the conjugated matched power, but many PAs don't operate in this
regime (as my very extreme class-E case). It was the reason for
mentioning:

"A certain load that has mismatch referenced to 50 Ohms may have a
nice
match to a system with non-50 Ohms output impedance."

The problem is in whether you define mismatch based on the ohmic value
printed on the back of the PA, or on the actual output impedance of
the PA (that you mostly don't know in case of many solid state PA's).

As the actual output impedance of the PA may not be 50 Ohms (for
example 100 Ohms), a 50 Ohms load (as mentioned on the back of the PA)
will provide the stated power (for example 100W). By applying 100
Ohms (that is VSWR =3D 2 for a 50 Ohms reference), the net power will
increase to 112 W. Actually it wasn't me to experience this mismatch
isue first, but my father during the time that CB was very popular
overhere.

The above example assumes that the output impedance of the PA is
independent of load. Of course this is only true when the actual

voltage across the active device and current through it doesn't
saturate the active device too much.

I think the saturation issue is one of the advantages of a linear PA
with accessible R an X tuning. You just tune for maximum output given
a certain load and drive (you may use plate current as a guide also).
As long as your SSB signal's PEP stays below that output power, your
active device will not go into voltage saturation and IMD will likely
be acceptable.

In case of a wide band push-pull PA, VSWR =3D 2 (with inconvenient
phase) may provide a load where the active devices (mosfet or BJT),
will go into voltage saturation at a net output power below the rated
power of the PA. For constant envelope modulation this isn't problem,
but for SSB/AM it isn't good.

With kind regards,

Wim

Hi Walt,

Irrespective of who the author is of this statement (I've lost track),
I too would like to see how this is reconciled.

But seeing that you've asked several times....

Thanks for the reply, Wim, but you seem to be evading my questions and concerns by what appears to be going off on tangents unrelated to my questions.

Perhaps I need to refresh Electronics 101, because I simply can't understand the example you provided.

You have a 100-ohm source terminated with a 50-ohm load that provides 100w. But you say with the VSWR =3D 2 the net power will increase to 112w. How does this happen?

Wim, you are making statements that seem to disagree with known principles, yet you give no explanation of how these statements can be justified in relation to the known principles.

And please tell me, Wim, what RF amps do you know of that have the source impedance indicated on the back? And you refer to solid-state amps, when you know my discussion (and experience) is with tube amps with pi-network outputs. I am totally ignorant on the operation of solid-state amps.

I would like to be learning something from my discussions with you, but I'm sorry, Wim, you're making me feel more stupid the more we continue.

Walt

> 112w. How does this happen?

Walt, here is probably what Wim means by that.

Source------1/2WL 50 ohm lossless------RLoad

Vsource =3D 212v, Rsource=3D100 ohms

If Rload =3D 50 ohms, PLoad =3D 100w

If Rload =3D 100 ohms, PLoad=3D112.5w

Wim must be assuming a 50 ohm SWR in both cases.

Dear Wimpie: Many thanks. I am always on the look-out for applied electronic problems for a colleague who is particularly skilled at crafting practice problems for the professional engineering exam (chartered engineer in Europe).

Your comments about filter response reminds me of the (analog) FM receivers that had wonderful suppression of the next channel over, but horrible performance in the presence of noise from ignition - while other receivers had great performance in both respects. As you know, it had to do with phase response. Chebyshev is not always desirable.

Warm regards,   Mac   N8TT

Hello,

Regarding the defined output impedance.

The first time was during my thesis (third harmonic peaking PA). The stability margin was not very large (expected), and it could be improved by keeping the impedance seen from the base within certain limits. My teacher said, be careful, you only have two devices (BLW76). I tried to make an exciter (based on 2SC1307 BJT) with defined output impedance, but without success. So in the end I increased the output power of the exciter and inserted a 3 dB attenuator, not elegant, but it did the job.

The second time was for H-field generation where wider bandwidth was achieved by adding a second resonator. When driving from a 50 Ohms source, it had a nice Chebyshev type pass band. Because of the ripple, it shows reflection in the pass band (this happens with Chebyshev response). However when driving from a PA (that was flat within the pass band when loaded with 50 Ohms), everything went wrong.

I redesigned the filter/coil combination, designed a switching PA (half bridge in class DE operation) and skipped the 50 Ohms (I designed around 8 Ohms). The PA drives the filter directly in such away that most of the time the PA sees a nice (mismatched) load (that is inductive for harmonics). This resulted in the desired pass band with significantly increased efficiency. The strength of the H-field is controlled by varying the supply voltage (PWM circuit).

Leaving out the 50 Ohms in between, saved several capacitors and inductors.

With kind regards,

Wim

```

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

```
 radio/personal-intro
 Subject: Guide to the rec.radio Newsgroups
 Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
 Last Posted: 9 Nov 2001 06:18:17 GMT
 Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article       |
is that it does not mention newer amateur radio newsgroups created since      |
it was written, including:                                                    |

 rec.radio.amateur.antenna                                                    |
 rec.radio.amateur.boatanchors                                                |
 rec.radio.amateur.dx                                                         |
 rec.radio.amateur.equipment                                                  |
 rec.radio.amateur.homebrew                                                   |
 rec.radio.amateur.moderated                                                  |
 rec.radio.amateur.space                                                      |
```

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to rec-radio-info-request@panix.com.

A further note about the 4170 series:
1. A unit now exists that extends the upper range well into UHF.
2. In the last few days, a free software revision transforms Z vs. frequency into time vs. magnitude of Z. In other words, it displays as a TDR would.

Hi, All.

Brand new to the newsgroup, here, and even though I did the old "Find" routine, I couldn't find what I need.

Does anyone know where I can get instructions (preferably cookbook, but if they come with formulas, I can deal with that, too) for building a 2m SSB horizontal loop? I live in an apartment, which is pretty much a Faraday cage, but I get out pretty well from my balcony, at least to the east(ish) of the building. I have a discone out there right now, clamped to the floor stand of an old oscillating fan that it used to be attached to. :-) I have

a similar portion of a floor lamp that I want to mount the loop onto. I
need something that will cover at least the 180� that my discone can radiate
in, as well as it does. Since 2m SSB is typically horizontal, the discone
doesn't do too well. Any help will be greatly appreciated.

Myself I'd probably stick a small 3 el yagi on that
lamp mast if you had room..
Good bit more punch for SSB, and being things are
reciprocal, it will improve reception. If you squeeze
an extra 6 db from the antenna system, that's like
taking 50 watts and turning it to 200.
Best deal on an "amp" you will find.. :)

I'm not sure the gain using a halo, but I suspect
it's probably pretty close to a dipole. Maybe a tad
more, but it's not going to be a drastic difference.
A loop has some gain broadside vs a dipole, but I'm
not sure what you get running one on it's side.

Not very good. Most of the RF goes up. It is particularly bad along the axis of the driven wire (assumes wire driven in the center). Not quite as bad normal to that axis. Might be improvable by feeding the corner.

I think a simple vertical would do better.

Cheers,
John

I forgot that the OP wanted horizontal polarization. Well, if it were me, I'd make the loop vertical and feed the bottom center. That will produce a horizontally polarized signal much better than the horizontal loop and with about the same directivity.

A 'Halo' is the usual answer, or if more space is available crossed dipoles.

Jeff

There is an antenna that Cushcraft used to make called a big wheel.
It had three full wave loops attached in parallel at the center.
I have 4 stacked big wheels which suppress vertical emission and
emphasize horizontal transmission. I have used this on 2M sideband
and FM. If you can get the instructions for a single big wheel from an
old ARRL antenna book, then I can give you some hints on phasing.
I expect that you will only be able to stack 2 on your balcony.

Hello Walt,

The source delivers the stated power in a 50 Ohms load (so the back of the PA mentions 100W into 50 ohms, nothing more). It is the same as for my class E thing, it mentions 500W into 4.5 Ohms load. It doesn't state that the output impedance is < 1 Ohms. So if one provides mismatch (referenced to 4.5 Ohms), the PA may give more net output.

I hope this makes all clear.

Wim

Hello,

I assumed a black box with a voltage source in it with EMF =3D 213Vrms and a 100 Ohms resistor in series.

Above the UHF socket it mentions: "100W into 50 Ohms".

Please calculate for yourself the net power delivered into a 50 Ohms load, and into a 100 Ohms load (VSWR=3D2, referenced to 50 Ohms). As 50 Ohms is mentioned above the UHF socket, VSWR is referenced to 50 Ohms.

Wim

Thanks much. I'll have a look at that link and see what's what. The Yagi would be nice, but running out on the balcony and moving it around all the time isn't practical. That's why I wanted something fairly omnidirectional, as much of "omni" as I can get, anyway. Since I remember what my communications instructor told us about loops (they radiate equally poorly in all directions <g>), I figured this would be the most practical solution for what I want to do.

Another possible idea could be the turnstile.
That is horizontal, pretty omni, and pretty simple

to build. Just a set of crossed dipoles fed 90 degrees
out of phase. I think you would have less gain vs
the broadside of a dipole, but you wouldn't have the
nulls off the ends.

off-topic

Hello Mac,

The Chebyshev is not may favorite filter response, but it gave the
required bandwidth increase (from my head more then factor 2).

When using a zero ripple response I had to use more resonating circuits and the client didn't like that. Now there is one straightforward adjustment only (that can be done in the field when required).

With regards to the in-band behavior, I had an almost similar problem in an FM narrow band application that another department couldn't get within specs. They used a very steep Chebyshev filter, but they couldn't meet the internal SINAD spec=85. Another filter with less pass band ripple solved the problem.

Two years ago similar problem in an optical receiver. The client was happy that it could be solved by optimizing the digital detection SW.

With kind regards,

Wim

Not for SSB it wouldn't. 20dB or so isolation V to H. Useless unless
within less than normal FM range.

On the flip side I've done well over 100 miles car to car with single
halos on each end with roughly 80 watts. And up to 200 with 2 stacked
halos (3 foot stacking, not much really) to a single 3 wavelength yagi
on the other end. Not a one time thing, I used to drive NNY at about
1000 miles per week doing service during the early 80's.

There are better things than the halo. The omni-angles are quite a bit
better, especially on the pattern and are simple and rugged. Less than
1 dB gain change over 360 degrees toward the horizon. A Motorola design
(that I don't remember them using) that got re-purposed for amateur.

And then there's the Big Wheel and a modern twist on it that is even
better and smaller.

Consider the fact that as it is on a balcony, I assume there is a building
with
a balcony on the side, then you would do with a simple dipole as any
signal sent into the building is only wasted. I am not sure but it would
probably have a good off balcony signal pattern too -- better than most
other antenna arrangements I can think of/

It's cheap and quick and wouldn't take much effort to try.

A horizontal dipole in front of a screen or single reflector would have
a "pattern" that is 100+ degrees wide.

Stack a couple vertically, say a meter apart, and you squeeze the
vertical beam width significantly, which is probably what you want.

What you *might* want to do is look for a low gain TV antenna for the
upper VHF bands (e.g. Channel 7-13): one of those two bay things with a
bowtie in front of a screen.

Let's take an example of a power amplifier, followed by an isolator, and
then your load.

> But Wim, you pulled a fast one one us!!! Until now you didn't tell us
> that the source resistance of the source was 1 ohm!!!

This whole discussion started with the observation that most solid state
amateur amplifiers probably do NOT have an output impedance of 50 ohms,
and that, in fact, the output impedance isn't particularly well defined
(i.e. it changes over frequency and power level).

And, given that, whether you achieve a "match" may not be the best
overall system solution (in terms of AC power in to radiated EM wave)

The problem really is that a simple small signal linear circuit theory
approach (which is what Thevenin equivalents and maximum power transfer
theorem are all about) breaks down, especially when you consider that
actual amplifiers have operating area limits that are some combination
of current, power, and voltage, and that amplifiers and power supplies

have efficiencies that vary a lot depending on the operating point.

Maximum Power transfer/conjugate matching applies only at the single reference plane, and is convenient for analysis, but doesn't tell much of the story when it comes to overall system performance.

A related issue is noise figure performance, where a well-matched system (which would transfer maximum power from the antenna to the LNA) sometimes isn't what you want, because it's optimally transferring the noise power from the source resistance.

Hi Jim,

Taking that example doesn't explain the numbers in Walt's frequently asked question (which I understand by John KD5YI's header information was originally your assertion, not Wim's).

>This whole discussion started with the observation that most solid state
>amateur amplifiers probably do NOT have an output impedance of 50 ohms,
>and that, in fact, the output impedance isn't particularly well defined
>(i.e. it changes over frequency and power level).

The whole discussion that stops at that point is jejune. There is SOME output impedance at SOME operating point and the rhetorical device of saying it isn't 50 Ohms isn't very informative.

>The problem really is that a simple small signal linear circuit theory
>approach (which is what Thevenin equivalents and maximum power transfer
>theorem are all about) breaks down, especially when you consider that
>actual amplifiers have operating area limits that are some combination
>of current, power, and voltage, and that amplifiers and power supplies
>have efficiencies that vary a lot depending on the operating point.

Consistently across the board, ALL of Walt's papers and publications have carefully defined the operational criteria to satisfy exactly those issues and to remove them as objections from "the whole discussion started with ... output impedance." Ignoring that contribution, and refusing to argue those points, the critics then re-inject these issues to condemn Walt's conclusion.

Hello Cecil,

Your assumption is correct! To avoid confusion, I mentioned: "that is
VSWR =3D 2 for a 50 Ohms reference", but maybe it is because of English
isn't my mother tongue.

I think it is not unusual to use 50 Ohms as reference when the output
specification says: "100W into 50 Ohms".

With kind regards,

Wim

I might just go that direction, Irv, depending on how things look with other designs. Thanks!

Wim, why is it that you can't seem to answer my question concerning the amount of power reflected from a 2:1 mismatch? The following is what you said in reply, totally ignoring the details in my question:

>The problem really is that a simple small signal linear circuit theory
>approach (which is what Thevenin equivalents and maximum power transfer
>theorem are all about) breaks down, especially when you consider that
>actual amplifiers have operating area limits that are some combination
>of current, power, and voltage, and that amplifiers and power supplies
>have efficiencies that vary a lot depending on the operating point,

Your response above is totally evasive, and I can't understand why you would do this. There is a specific correlation between source power, forward power and reflected power, such that with a 100w source in a 50-ohm system, a 2:1 mismatch, when the reflected power is re-reflected the forward power is 111.11w, reflected power is 11.111w, and power absorbed in the load is 100w.

Now please explain with rigorous physics and math, how with a 100w source and a 2:1 mismatch you can justify a forward power of 130w and a reflected power of 15w. Is the fact that there is no way these values can exist is the reason you're evading answering the question? If someone who is unfamiliar with the truth in this instance came up with these absurd numbers, and who is willing to admit a mistake, I'm willing to forgive a mistake. But if you are stonewalling, is what it appears to be, then I'm not amused. And you should be ashamed for doing it.

Walt, W2DU

Walt -

If the load reflects 11.111... percent of the forward power, and 100% of reflected power is re-reflected by the source, then how/why in your example is the power absorbed by the load equal to the original incident power of 100W?

A re-reflection for these conditions is not 100% absorbed by the load, rather 11.111% of it is reflected back to the source. Only ~88.889% of that first re-reflection is absorbed by the load. Ditto for all further re-reflections of the first reflection.

Assuming no loss in the transmission line, and phase coherence at the load for all forward power, wouldn't the load power accumulate per the table below -- which shows the initial forward power absorbed by the load with the first ten re-reflections of it by the source?

88.889   watts
1.23454321
0.137170096
0.015240969
0.001693424
0.000188156
2.09061E-05

```
 2.32287E-06
 2.58094E-07
 2.86769E-08
 3.18629E-09
- - - - - - - - - -
90.27785937 watts, total
```

Then the next question is what happened to the "missing" power?

Quite. There's not much point in striving to achieve omnidirectional
coverage if half the RF will be coming back into the building, and
getting lost.

However, in the interests of minimising interference (to and from the
electrical devices in the building), it might be advantageous to
minimise radiation/reception in that direction by using something at
least 'somewhat' directional - maybe a 2-element yagi, or an HB9CV?
http://www.mydarc.de/dk7zb/HB9CV/Details-HB9CV.htm

and hundreds more.

It appeared to me that Walt was talking about the SWR in a matched
system, i.e. Zs=3D Z0=3DZload=3D100 ohms. There is rarely an actual
technical disagreement between two technical heavyweights because we
all studied the same textbooks. :-) Seems to me, about 95% of all
technical arguments are semantic in nature.

For instance, from our earlier discussion, I believe that you consider
the redistribution of RF energy associated with interference between
waves to be a "reflection". To my way of thinking, a "reflection" is
something that only can happen to a single wave, i.e. you and I may be
presuming a different definition of "reflection" which is a semantic
problem.

Xref: g2news1.google.com rec.radio.amateur.antenna:21280
```

I've been wanting to build a Lazy H antenna for 10 meters for some time now. Last summer I purchased a new house with some land, and I decided to give the Lazy H antenna a try. According to the ARRL handbook a Lazy H antenna with 1/2 spacing between the top and bottom elements has 5.9 db gain over a half wave dipole. At 5/8th wave spacing between the top and bottom elements the ARRL antenna handbook claims the Lazy H is suppose to have 6.7 db gain over a 1/2 dipole. In the real world I have found the Lazy H to actually have less gain than a 1/2 wave dipole at both 5/8th wave spacing and 1/2 wave spacing.

I viewed the W8JI web page concerning the Lazy H. I used 450 ohm ladder line between the top and bottom elements, and I center fed that piece of ladder line with another 100 foot run of 450 ohm ladder line back to the shack. The ladder line runs perpendicular away from the Lazy H. I attached the ladder line to the balanced line input on my Dentron MT-3000 antenna tuner.

Dentron MT-3000
http://www.eham.net/reviews/detail/868

The first thing I noticed is I have to turn the antenna matching adjustment all the way to the right to get the SWR to come down, and the transmitter matching to about 3 o'clock. I've never had to turn the antenna matching adjustment that far for any other antenna to match. I also hooked the ladder line to my Drake MN-75 antenna tuner with the 4:1 balun installed and the adjustments on the Drake antenna tuner where about the same as the Dentron MT-3000.

The top wire on the Lazy H is at about 45 feet. I also have a coax fed 1/2 wave dipole for 10 meters at about 30 feet. I live near Charleston, South Carolina, and I have both the dipole and the Lazy H broadside to southern California.

I did multiple A/B comparisons between the 1/2 wave 10 meter dipole and the 10 meter Lazy H and this is what I found.

Charleston, South Carolina to Arkanasas via sporaic E skip
- The dipole easily out performs the Lazy H

F layer skip....
Charleston, South Carolina. to Arizona
- The dipole easily out performs the Lazy H

Charleston, South Carolina to California
- The dipole easily out performs the Lazy H

Charleston, South Carolina to Hawaii
- The dipole and the Lazy H are about the same

When sporadic E skip rolled in from Ohio the Lazy H demonstrated the expected null to the North.

I have rechecked all the connections and they are correct. I verified the connections with an ohm meter and the top left element is connected to the bottom left element. The top right element is connected to the bottom right element. There is no connectivity between the left and right elements which is what the handbook shows. There is no twist in the ladder line that connects the top and bottom elements. This is a center fed Lazy H, and not a bottom fed Lazy H. I verified the Lazy was in fact pointing in the correct direction by rotation my dipole to null out signals coming from California. I noted the direction with my compass, and then I made sure the Lazy H was broadside to that direction on the compass.

Has anyone seen real world gain with the Lazy H on 10 meters verses a dipole? My experience shows it consistently lags behind the 1/2 wave dipole even through the Lazy H is 10+ feet higher than the dipole.

I also built an extended double zepp for 10 meters with a 450 matching section to a 1:1 balun and then to coax, and the extended double zepp consistently out performs the dipole in it's preferred direction.

I might just go that direction, Irv, depending on how things look with other designs. Thanks!

That's another good idea. Thanks. Are the elements of a turnstile spaced a
quarter wavelength apart, or are they pretty much on top of each other?

On top of each other. Fed 90 degrees apart.

But I'd try a dipole first.

On May 10, 10:01=A0am, Richard Fry <r...@adams.net> wrote:

> On further study it appears that the sum of the power contained in all perfect, coherent re-reflections from the source that will be absorbed by the load is asymptotic to the value of the power absorbed from the original incident wave (lossless transmission line).

There are two mechanisms responsible for the redistribution of incident reflected power on/at the source back toward the load.

1. The incident reflected EM wave energy can be partially re-reflected from a physical impedance discontinuity at the source and merge with the forward EM wave energy. Note that "reflection" is something that happens to a single wave.

2. The components of the reflected EM wave energy that are not directly re-reflected can undergo superposition with other coherent EM waves and, associated with destructive/constructive interference, their energies can be redistributed back toward the load. Some consider this to be a re-reflection but it is NOT since it involves superposition of two (or more) EM waves.

Given that b1 =3D s11*a1 + s12*a2 =3D 0, what happens to the powers, (s11*a1)^2 and (s12*a2)^2? If that energy is not moving toward the source, it is moving toward the load and contained in (s21*a1)^2 and (s22*a2)^2. That power is NOT a reflection. That's the conservation of energy principle in action associated with destructive/constructive interference.

When one calculates the source impedance based on the total redistributed energy, one makes a large error when one assumes that all of the redistributed energy is "reflected". It is possible for there to exist zero re-reflected power while all of the reflected power is redistributed back toward the load through superposition associated with destructive/constructive interference. That's exactly what happens in one of W7EL's food-for-thought#1 examples.

When W7EL's source sees an infinite impedance, there is zero power dissipated in the 50 ohm source resistor. However, since we are using 50 ohm lossless coax, the Z0 of the coax is equal to the Zg of the source so there are no re-reflections at the source, according to the reflection model. Is that a contradiction as W7EL seems to suggest? Absolutely not! He is simply missing the redistribution of reflected energy back toward the load as constructive interference in balance with the destructive interference at the source resistor.

In s-parameter terms, if b1 =3D s11*a1 + s12*a2 =3D 0, then all of the incident reflected power must be redistributed back toward the load - but not through re-reflection - just a necessary result of destructive interference at the source resistor. I'm sure they exist but I personally do not know any hams who understand that fact of physics well recognized from the field of optics.

>
> Now please explain with rigorous physics and math, how with a 100w source and a 2:1 mismatch you can justify a forward power of 130w and a reflected power of 15w. Is the fact that there is no way these values can exist is the reason you're evading answering the question? If someone who is unfamiliar with the truth in this instance came up with these absurd numbers, and who is willing to admit a mistake, I'm willing to forgive a mistake. But if you are stonewalling, is what it appears to be, then I'm not amused. And you should be ashamed for doing it.
>
> Walt, W2DU

Hello Walt,

I thought you would be able to do this yourself, so I only stated the net delivered power to a 100 Ohms load (that is the 111W), though the delivered power into the stated 50 ohms is 100W. The example was to show you with numbers what I experienced in practice when I was 16 years old and repeated it when I had access to good equipment (mentioned before).

In addition, it is not relevant to the output impedance issue of a PA, as you can calculate the increase in power due to mismatch (referenced to 50 Ohms) by just using Ohm's Law.

But here it comes:

We have 111W dissipated into a 100 Ohms load (from the EMF calculation, assuming 100 Ohms Zout for the PA and EMF =3D 212.1 Vrms). Reference for waves is 50 Ohms (according to the text on the back of the PA: "100 Watts into 50 Ohms"). We assume an electrically very small piece of 50 Ohms coaxial cable between the socket and the 100 Ohms load. This could be your reflectometer. If you like you may insert 0.5 lambda so that the PA sees 100 Ohms.

100 Ohms equals |rc| =3D 0.3333 (50 Ohms reference), I assume you know how to calculate this.

Hence "reflected power" =3D 0.333^2*"incident power" =3D 0.111*"incident power".

"net delivered power" =3D "incident power" =96 "reflected power" =3D 111W.

"net delivered power" =3D (1-0.11111)*"incident power" =3D 111W.

"incident power"=3D 125W, "reflected power" =3D 14 W

Do you realize that when using transmission line resonators (or filters) the forward and reflected power INSIDE the resonator can be very high, while the net input power can be very low?

Wim

Hi Michael,

Then, there you have it (in your last sentence).

With a quick google of "Lazy H antenna" I find two ways to build one (the difference being in the twist of the shared drive line between the top and bottom elements when fed at the bottom). There are plenty to ways to erect it wrong - to someone's sense of propriety.

Now, as to the gain. Commons sense (divorced from the effects of ground) tell us that if one dipole has X gain, then two with the best of additive aspects could only have 2X gain (3 dB). To say you can achieve more than 6dB is another doubling without adding anymore radiator (and performed only by some unspecified magic).

More the issue seems to be reporting gain. The numbers seem to be dBi figures that are then compared to a dipole with the presumption the dipole gain could be expressed as 0dBi.

Lastly, the Lazy H is designed like a two element yagi pointed directly into the ground (go figure). There is some appeal to this design being a curtain array (a topic for consideration), but then what price in gain is being paid with the lower element hugging ground. It couldn't possible radiate better than a similarly ground hugging dipole (and yet all the praise seems to ignore this common sense). The higher element certainly has a better chance, but then so does a dipole at that altitude. So, how do you compare the two designs? The simple dipole at the lowest element's position? or the highest element's position? or split the difference?

WOW towards the end of the article, look at the gain from it?
Quote   "Then found 14 other WISP APs including town D, 7.8
miles away." end quote.

As for the FCC, my inner self morals tell me to never let
anyone regulate antena theory and or education, sure I'll go
along with freq and power out control but refuse to conform to
antenna regs. Accept for "Height" of course.
This gadjet is impressive, and yes I love Covert WiFi
conections this one is on my list of things to do.
As long as I have a soldering Iron, who needs to
worry about "Connector" types and models hey hey.
Now for the PC flamers? We'll go ahead waist your time at
will.

Hi Richard,

It doesn't matter what somebody designed in the past. I think my example regarding net power increase due to mismatch (referenced to 50 ohms) was fully clear.

Stressing on forward and reflected power (several times) may give rise to the thought that somebody can't solve such a transmission line problem himself. Note that I wasn't the one that brought up this issue (as Jim noted also), but I know the stated figures aren't strange.

I use a similar example in my antenna measurement classes to show that just calculating additional loss due to mismatch may go wrong completely when Rsource or Rload don't equal the reference impedance (mostly 50 Ohms).

This is a very curious reply given that everyone of us here has
responded to the topic with past accomplishments.  So it MUST matter,
otherwise you have just impeached your own credentials citing
experience at age 16, in work for a thesis, and work of the (recent)
past.

> I think my

So clear that it has to presume Walt doesn't know transmission line
fundamentals?
```

>(as Jim noted also), but I know the stated figures aren't strange.

So, by your emphasis on forward and reflected power (several times) I
presume you can expand upon your application of transmission line
mechanics to offer something other than an oblique comment that
nothing is strange about:
>> Now please explain with rigorous physics and math, how with a 100w
>> source and a 2:1 mismatch you can justify a forward power of 130w and
>> a reflected power of 15w. Is the fact that there is no way these
>> values can exist is the reason you're evading answering the question?

If, by any chance of miscommunication, you do find this last quoted
statement strange; it would be clarity itself to simply say so and we
will wait for Jim to sort this out.

This is for Richard Fry,

Richard, because the output source impedance of a p-network following a tube RF power amp is non-dissipative, no reflected wave enters it to be dissipated. Instead, the reflected power is totally re-reflected back into the line. The only loss from there on is due to line attenuation. The same is true when using an antenna tuner, total re-reflection. Thus, when ignoring the line loss, with a source power of 100w and a load mismatch of 2:1, the reflected power after reaching the steady state is 11.111w, and when added to the source power, the forward power is 111.11w.

Here is what I believe you missed: When the 111.11w arrives at the mismatch, 11.111w is reflected, leaving 100w dissipated in the load.

Correction for Richard Clark: My designs were for the dish antennas that went on the Moon buggies, and the antennas that flew on the 1st nine weather satellites. I also designed one of the quadrifilar helix antennas now flying on the polar-orbiting NOAA weather satellites. Not Telstar.

Now Wim, your math is very challenging: You state 100w delivered by the source, but at one point you also state 111w is delivered to the 100-load--at another point you state that 100w is delivered to the 100-ohm load. Which is it?

You also state that voltage out of the source is 212.1v--sum ting wong here. 212.1v across 50 ohms yields 899.73w, and 212.1v across 100 ohm yields 449.86w. These power values are nowhere near the values appearing in you statements.

In my calculations, with 100w the voltage across a 50-ohm line is 70.71v, and across a 100-ohm line the voltage is 100v.

With a 50-ohm line terminated in 100 ohms, the vrc is 0.3333 as you stated, thus the power-reflection coefficient is 0.1111. This means, as I've stated continually, that with 100w delivered by the source, the power reflected at the 2:1 mismatch is 11.111w, which when added to the 100w supplied by the source, makes the forward power 111.11w. Now with 11.111w of power reflected at the mismatch, this leaves 100w delivered to the 100-ohm load, not 111w. Please tell me where the 111w came from. You also haven't told us why you calculate 130w forward and 15w reflected. Someone else may have made these calculations, but it was you I asked for an explanation, because you repeated those calculations.

When using the correct physics and math in this example, how can the results be so different?

To close, let me present the procedure I use to calculate the total forward power--I guess it is related to Ohm's Law:

With the power-reflection coefficient as prc, the forward power PF =3D 1/ (1 - prc).

So Wim, can you clarify the confusion you appear to have made?

Walt

Hi Walt,

Your paygrade is still intact.

>Now Wim, your math is very challenging: You state 100w delivered by

There seems to be a contagion of problems infecting this thread. Quite typical for this class of discussion, unfortunately, with so many "substitutions" offered in place of sticking with the subject.

>You also haven't told us why you calculate 130w forward and
>15w reflected. Someone else may have made these calculations, but it
>was you I asked for an explanation, because you repeated those

However, it is still Jim's cross to bear on this slow path to Calvary.

Walt,

Let us start at T=3D0. The transmitter is keyed, and instantaneously delivers 100W to the input of a lossless transmission line. That 100W travels to the end of the transmission line and encounters a load connected there having a 2:1 mismatch to the Zo of the transmission line.

That load will dissipate about 88.889W, and reflect about 11.111W back to the source.

Likewise, the load will dissipate only 88.889% of the RE-reflected power from the source for the same reason it dissipated only 88.889% of the power in the original incident wave.

So even if the RE-reflection from the source is lossless, and phase-coherent with the original incident power at the load, how does this yield the 100W of load dissipation that you posit?

RF

The PI network between the tube and the output connector transforms the tube Hi-Z to 50 Ohms (or any other suitable Z); however, the same PI network's input Z (from the perspective of the returning, original reflection) is NOT 50 Ohms, it is the complex conjugate (whatever 2:1 brings to the table) of the load answering phase-coherency, hence it reflects the reflection (by the same mechanism of mismatch) to the dissipative load the antenna, and thus into the �ther.

The transmission line is bounded at either end by identical mismatches in conjugation. There is a "ringing" in the line, which at only one end there is dissipation (neglecting loss and damage to the tube for exceeding maximum tolerances, of course).

For Richard F.

Where does the 88.889w of power delivered to the load come from? I
calculate it as 100w. 100/111.11 =3D 0.9000. Since 11.111w of power
reflected at a 2:1 mismatch with a 100 source and lossless line is
indisputable, then the mismatched load will dissipate 90% of the
forward power. 90% of 111.11w is 100w. So please explain the
significance of 88.889w. I can't see it as relevant.

Walt

Yes, consider a source with 70.7 volts at its output terminals connected to a 50 ohm load through a 50 ohm feedline. Except for source efficiency, the source impedance simply doesn't matter. Any 70.7 volt source will deliver 100 watts to the feedline no matter what the source impedance.

There's a simple method called load-pulling. Keeping everything the same at the source, if the power to the load increases when the load is changed away from 50 ohms, the source doesn't have a 50 ohm internal impedance.

> Measuring the output impedance (for relative small change in load) is possible, but is not a simple task. Very likely other people will comment on this.
>

ON9CVD's website I linked to has a very simple technique.. 50 ohm dummy load and a 220 ohm resistor you can switch in.

At 100W (into 50 ohms), the 220 ohms would only dissipate 22W. You could get some of those non-inductive resistors from Caddock and series them up to do something like this.

BTW, this is a simplified version of what's called a "load pull" test... which makes me wonder if one could cobble up a quick test set that could be controlled by a computer to do automated output Z measurements of an HF transceiver over a reasonably wide range... One approach would be to use a RS-232 controlled antenna tuner and, maybe, a antenna relay box with several different load resistances).

The challenge (having actually looked at doing this with a LDG AT200PC) is that the Z of the tuner isn't very well defined. It's a pretty big calibration project in itself.

Maybe, though, one could build a few test dummy loads.. say a 25 ohm and

a 75 or 100 ohm, along with your vanilla 50 ohm, and the antenna switch
(like an RCS-8V). Basically, you're building a "high power resistor
substitution box"

You'd want some sort of nice inline watt meter (like an LP100) to make
the measurements.

Not exactly..

A "match" provides the optimum power transfer from generator to load, but that is NOT the maximum load power, nor is it either the maximum or minimum power dissipated in the source.

Say I have a zero output impedance on my source and I'm putting out 7 Volts RMS into a 50 ohm load. That's about 1 watt into the load. Now.. if I reduce the load impedance to 25 ohms, and since I've got zero output impedance, I'm now putting out 2 Watts. The source impedance is zero, so I'm not dissipating any extra power in the source, either.

It is true that a "matched load" to my zero ohm source would, in fact, be zero ohms, and would have infinite power. Any other load impedance would have less power into the load, so the Thevenin theorem is satisfied.

Now.. if my generator had a fixed output impedance, it's true that the load impedance that will get the most power out is the conjugate of the output Z. For resistive sources/loads, here's an example..

You also have to be careful about looking at Thevenin equivalent sources (e.g. a ideal voltage in series with a Z, or a ideal current in parallel with a Z), because just because *the model* has a resistor in series does NOT mean that you're actually dissipating any power in the source. (If I had a very efficient op amp, I could simulate any arbitrary output impedance, without dissipating any power in the source)

Say my generator is 40 ohms, and I'm putting out 7 Volts into a 40 ohm load. OK, that means that the imaginary voltage source is putting out 14 V. I'm getting about 1.23 Watts into my load. Now, if I decrease my load Z to 20 ohms, what do I get? Now, I have 4.67 (=14/3) Volts instead of 7, and I get 1.1 Watts. Yep, less.. Thevenin works. Let's try increasing the Z to 60 ohms.. Now the voltage on my load is 8.4 V, and I'm dissipating 1.18W, again, less than my 1.23.

But here's some weird stuff.. let's look at how much power is dissipated in that imaginary resistor (i.e. our source *really is* a ideal voltage source in series with a resistor)

At 40 ohm load, we've got 7 volts on the load and 7 volts across the resistor, so they both dissipate the same 1.225 Watts. Pload/Pgen = 1

In the 20 ohm load case, we've got 1.1 dissipated in the load and 2.2 dissipated in the generator. Pload/Pgen = 0.5

In the 60 ohm load case, we've got 1.18 dissipated in the load, and 0.78 dissipated in the generator. Pload/Pgen = 1.5 (i.e. we dissipate more in the load than in the generator... how about that!)

And let's look at "efficiency" of the system (assuming that the total power in is the sum of what's dissipated in the generator and the load)

20 ohm load, 33%
40 ohm load, 50% (what you'd expect)
60 ohm load, 60% (hey.. it's more efficient, too)

-> take home message... a "good match" is sort of an artificial thing from a power transfer standpoint.. it depends on what you're trying to optimize for.

-> Where you get bitten is when "match" varies with frequency... now, all of a sudden, you have a system that has a response that varies with frequency, which is generally undesirable. When you get up into the microwave region, where a transmission line is often many wavelengths long, that mismatch can result in remarkably wild fluctuations in gain with respect to frequency.

Hello Ralph,

The actual output impedance can be anything, but is mostly not 50 Ohms. If you want it close to 50 Ohms, you have to spend money in components and design time. As 50 Ohms isn't mostly required, one will not design for that.

Just as an example, take a hard-driven totem pole or push pull stage with only a series tuned circuit to suppress harmonics (so the LC circuit shows zero ohms at the carrier frequency). As the active devices are used a switches, the output impedance of this arrangement is almost zero (at least far below 50 Ohms).

When you connect a 50 Ohms quarter-wave cable between the output and the 50 Ohms load, the amplifier-cable combination has very high output impedance (quarter wave transformer formula).

For power amplifiers, there is no relation between actual output impedance and efficiency.   When an amplifier is designed for 50 Ohms, it only means that the amplifier will work correctly when terminated with 50 Ohms. When you deviate from that, output power may decrease or increase. This may result in more or less stress on the amplifier's components.

With kind regards,

Wim

Thanks Richard. Intuition is that the Zs is near 50 ohms for as many frequencies as the designer can manage. I am on record (including in this group) of letting intuition lead me down the path to ruin.

I get from you that there's a presupposition that I know the source impedance or can easily establish it. Hm-m-m ... not so. One big problem I see is the need to try to measure power delivered in a non-50-ohm system with my existing instruments that depend on a 50-ohm system. I don't have a nominal 75-ohm power meter. Won't putting a 50-ohm meter into a 75-ohm circuit not only read wrong but introduce reflection losses, too?

I think I'd need a collection of non-inductive load resistors and an accurate rf ammeter. I'd need to connect them and calculate power at a few points in every band.

Maybe the papers that Cecil cited for me will fill in the gaps or suggest other approaches.

I can see why this is parenthetical, because it covers a lot of sins of omission.

First we bang up against the wall of Gain Bandwidth Product. If you are talking about resistive loads at low power DC, then your statement is trivially valid.

Second, the ability to "simulate" any arbitrary output (or input for that matter) impedance for an OP AMP is well defined in the closed loop gain (which robs from the open loop gain for frequency by proportion to GBP).

Taking the conventional RF Power Deck of any consumer (Ham) product, the similarity to an OP AMP is wholly foreign, and for good and commercial reason. If one were motivated to engineer in the necessary noise amplifier (a term coined by H.W. Bode who defined this topic of source Z and applied it to the negative gain or feedback path); then we would find that the exact same loss is exhibited in the exact same component(s).

However, by virtue of OP AMP characteristics we would benefit to vastly better distortion figures, far less spurious content, and virtually no need for either the conventional impedance transformer, nor the bandwidth filter that follows the same power deck (provided, of course, that the drive input is sinusoidal - which it never is, unfortunately, for this scenario). This novel OP-AMP/Power-Deck redesign would also confer considerable power supply rejection (that voltage could sag or rise without appreciable effect) and noise rejection (the internal noise from other circuitry would not migrate into the signal output). ALL such benefits are strictly derived from the amount of negative feedback (not to be confused, as are many readers to this topic, with the rather ordinary compensation cap in the last stage).

Why isn't this done as a service to the customer?

Cost.

Again, OP AMP design merits are paid for in lost gain and bandwidth. The price is found in the amount of negative feedback that goes to lower the overall amplification. Would you pay for this improved cool performance to run 10W in the 80M band from a formerly crackly and hot 100W 10-80M band capable source?

Hello Jim,

Other method is injecting a slightly off-carrier frequency signal into
the amplifier (this emulates a constant small VSWR shown to the PA
(wtih 50 Ohms load), but with continuous varying phase). Because of
the difference in frequency, one can measure the forward (towards the
PA) and reverse (reflected by PA) signal with a two channel VSA.
This will give you the PA's complex output impedance.

Tom (K7ITM from my head) did this with a HP89410 with couplers.

With kind regards,

Wim

Well, if you miss the path, you are certain to be reminded where it is.

>I get from you that there's a presupposition that I know the source

It is printed in the specifications. There are other ways to derive it, of course, and they would merely confirm that number.

It is easier to measure voltage and current and use your calculator.
Now having said that, measuring voltage and current is damned hard at
HF. It is achievable with care, but now we are back into your same
question with many hands pointing at that path to ruin.

As both are difficult (power or voltage times current), you could
trust authority (which confirms what is intuitive), or you could
listen to argument (which at the distance of time and recall becomes
murky and opaque).

>I think I'd need a collection of non-inductive load resistors and an

>a few points in every band.

Bravo! This reduces complexity because RF Power resistors of high
accuracy and bandwidth are commercially available. You will need to
practice your skill at mounting to a heat sink, however (another
non-trivial achievement).

>Maybe the papers that Cecil cited for me will fill in the gaps or
>suggest other approaches.

Walt and I have been corresponding over these matters just these past
two weeks. Skimming that content will once again confirm intuition.

yep.. not possible to build such a thing, anymore than one can build a zero ohm output impedance RF source with any signficant power.
Suggested more as an example that the power dissipation in the source doesn't necessarily correlate with match, load Z, or anything else in general.

(You can get pretty darn close at powers less than a watt and HF, though..)

One can also do a lot of this with various clever schemes if the input to your PA is coming out of some signal processing. Generically, predistortion, but it can be so much more.
People have literally spent their lives working out ever more sophisticated approaches

Yes.. that's another way to do it.

I think one would want variable load impedances for the testing in any case, because I'll bet that most ham rigs have a load dependent Z.

I've occasionally kicked around the idea of what would it take to do it simply, especially with nifty devices becoming available to help with the measurements.. $500 VNAs, $400 power meters that directly read current and voltage, etc.

What I'm not sure about is whether it is "useful" to know. Consider a ham with a manual or auto tuner. They'll adjust for minimum reflected power, which is probably as good as anything else. Hams, as a class, don't much care about "DC power to RF radiated" efficiency (because the regulatory requirements are imposed at the "RF output" measurement plane..

Power dissipation in the PA is only a second order concern.. can I plug it into a standard outlet? Will it get too hot in my car?

backpack QRPers are concerned about DC power consumption, but I'm not sure they're worried about whether their PA is 30% or 35% efficient.

The people designing battery powered tracking transmitters ARE concerned about this, as are high power broadcasters (since they're both directly paying for the supply power and have a "radiated RF power" requirement to meet their need).

You might want to consider moving this across to
rec.radio.amateur.homebrew or similar, this is more to do with the
antennas rather than the devices producing the signals themselves (the
transceivers).

In other words, my approach; make up a cable that allows you to access
all three conductors between the plugs, and use an oscilloscope to

identify the signals and signalling rates. Given the distance I wouldn't mind betting it'll be something along the lines of RS485. I doubt they'd try SPI or RS232 over that distance.

> What does the scoreboard manufacturer offer? (This has to be a
> reasonably common problem..)

+1... before you potentially void warranty. There's likely a 2.4GHz or 433MHz solution out there that will work and will be suitable for your local areas radio spectrum bandplans.

OP AMPs are a constant of my admiration in the possibilities offered.
That and the signal processing you suggest (plus digital oscillators)
"could" change the playing field - if conventional design weren't so
universally fallen back upon.

Unfortunately, the impedance encountered by the off-carrier frequency signal is probably not the same as the impedance encountered by the carrier frequency so the results don't correlate and are not very useful. The carrier frequency has interference components that the off-carrier signal doesn't encounter.

angsimpedantie.htm
>
> Grant Bingeman also has words on this:http://www.km5kg.com/loads.htm

I agree with Jim. While it's true that if a source (transmitter) is
tuned for maximum output, the output impedance must necessarily be the
conjugate of the load impedance, it is NOT generally the case that the
transmitter is tuned for maximum output. Rather, the transmitter is
tuned for an output that won't destroy the output devices and will
result in acceptable distortion (in the case of a linear amplifier).
There are plenty of cases of sources designed to be loaded with an
impedance far different from their output (source) impedance: the AC
power line, audio amplifiers, ...

A while back, I set up a couple precision high power directional
couplers so I could measure the output impedance of a couple different
ham rigs. In the case of the rig with vacuum tube output stage, if I
operated the output stage with limited grid drive and tuned the plate
tank for maximum output power, indeed the output impedance was 50
ohms, within the tolerance of my ability to adjust the output for
maximum. But if I increased the grid drive for solid class-C
operation and tuned for the rated output power (which is no longer the
maximum possible power), the impedance seen at the output dropped. If

you work through the pi-network transformation back to the vacuum tube plates, it's apparent that the plates under those operating conditions represent a considerably higher source impedance than when things are tuned for maximum available power (as first described).

But coming back to "Sal's" original question, it's always made sense to me given the availability of inexpensive 75 ohm line with low loss to go ahead and use it to feed antennas that have a feedpoint impedance closer to 75 ohms than to 50 ohms. If you need to provide a bit of matching at the transmitter end so that the transmitter is operating correctly, it should be straightforward to do that. But whether the actual source impedance of the transmitter is one value or another is really of very little importance. The only time I can think that it would matter is if you're trying to transmit a very broadband signal and you don't want power that's reflected at the transmission-line:antenna interface to re-reflect from the transmitter:transmission-line interface and go back to the antenna, delayed by enough to cause a "ghost" (in a television picture), for example. In such a case, you'll be well served by insuring that the antenna is well matched to the transmission line so there is an insignificant reflection there anyway.

Cheers,
Tom

Yep, 'twas me. Using the 89410, I can resolve a signal removed from the transmitter's output by a very small frequency offset, so it's well within the bandwidth of the transmitter. With synchronous averaging, the injected signal could be one or two Hz away from the transmitted carrier, though it helps a lot to have a transmitter running from a really "clean" (low phase noise) source if you're going to do that. The injected signal can be many tens of dB lower in amplitude than the transmitted signal. As I recall, I was using a signal a kHz or so away from the carrier, still well within the bandwidth of the RF power amplifier. One thing you have to be careful about is either disabling ALC, or operating well outside the ALC loop bandwidth; you don't want the ALC screwing up your results.

As Wim points out, this setup presents a load to the RF power amplifier that's indistinguishable from an R+jX load that's continuously varying, tracing a path around a little circle on a Smith chart (a very tiny circle, when using signals that are very small compared with the transmitted power). The rate the circles are traced out is just the frequency offset between the transmitter and the test signal.

Cheers,
Tom

Helo Cecil,

Depending on the frequency resolution of your VSA, the frequency of the injected signal can be well within 1 kHz of the carrier, so LC filters in the PA will not distort the measurement. In case of a 100W PA and injection of about 100 mW, the difference in wanted signal and signal to be rejected is 30 dB (not that large).

If you don't have a VSA, you can still do it (with some more calculations) by using a diode detector, this will give you the difference frequencies directly and you can observe the phase differences on an oscilloscope.

There can be a difference between a very slow load variation (for example manually changing loads and noticing current and voltage [including phase]) and the VSA method. This is because of decoupling capacitors in the power supply or bias circuits (for example RC combination in the grid circuitry to limit the grid current). If you vary the load about 10..100 times/s, bias and supply voltages don't have the time to settle to their steady state.

If the VSA method is basically wrong, I would love to hear why.

With kind regards,

Wim

Not knowing the nature of the signals on the cable makes this a
problem. Im betting it audio. Perhaps a wireless mike TX/RX
combination may solve your problem. If its digital there are RF MODEMS
available.

Jimmie

Being aware that this was the nature of my solidstate transceiver I
attempted to use a tuner with one to improve my match to my antenna
system. While I didnt damage my transmitter I did notice that the best
settings of the tuner for TX and RX did not coincide. I was wondering
if anyone else has observed this .

Jimmie

Would any competent optical physicist suggest that it is valid to
study the conditions associated with interfering coherent light waves
inside an interferometer by introducing an incoherent light source
into the system? Why would any competent RF engineer suggest that the
system source conditions associated with interfering coherent RF waves
can be studied by introducing an incoherent test signal?

Hi Jimmie,

This is somewhat cryptic, you would be expected to need a tuner.

>While I didnt damage my transmitter

This transcends cryptic. It's like saying that as you came to a stop
sign, you used your brakes and you didn't damage your car.

>I did notice that the best
>settings of the tuner for TX and RX did not coincide. I was wondering
>if anyone else has observed this .

Two different circuits inside, hence two different loads. Two
different loads, hence two different matches. Some receive paths
might be 50 Ohms, but that value is not as essential as for
transmission.

As this slightly off-carrier frequency signal behaves like a load with
very low VSWR with a cable in between that extends with constant
speed. In other words, the amplifier sees a constant VSWR, but with
changing phase. Small frequency difference results in slow phase
change of VSWR.

Maybe you should read the postings from Tom also (K7ITM)

Hello Jimmie,

I noticed this also when I was experimenting with CB equipment and
simple antenna experiments.

For several CB transceivers I could get more output by slightly
mismatching the load as seen by the PA (but in many cases with too
much increase in current consumption).

I tried to use a matcher/tuner (and later a high Q resonator) to
reject other stations close by and then I figured out that when
applying mismatch to the receiver, the S-meter moved further.

The above isn't strange. As PA's are mostly not designed to show 50
Ohms, many receivers are also not designed to show 50 Ohms. I am not
discussing wide band receivers (for example digital or analog video).

Most active devices have lowest noise figure when driven from a source
impedance that is far from the input impedance of the active device.
If you want them to be equal, you need to use feedback and that
complicates the design.

Also filters with significant pass band ripple show, even when
designed for 50 Ohms, significant input reflection when referenced to
50 Ohms

With kind regards,

Wim

From the IEEE Dictionary:

"impedance -

(1)(A) The corresponding impedance function with p
replaced by jw in which w is real. Note: Definitions
(A) and (B) are equivalent.

(1)(B) The ratio of the phasor equivalent of a steady-
state sine wave voltage ... to the phasor equivalent
of a steady-state sine wave current ...

(1)(C) A physical device or combination of devices
whose impedance as defined in definition (A) or (B)
can be determined. Note: This sentence illustrates
the double use of the word impedance ... Definition
(C) is a second use of 'impedance' and is independent
of definitions (A) and (B)."

The pinging experiment seems to be measuring a physical impedance (1)
(C) the nature of which is unclear. When the amplifier is outputting
power, it seems that the source impedance would be a V/I ratio (1)(B)
which doesn't respond to incoherent signals. Seems to me, you guys are
pinging something other than the source impedance.

Interestingly, it's NOT an incoherent test signal. It's a carefully chosen coherent test signal with a frequency difference. It's the same idea as having an interferometer with dithering piezo transducer on a mirror or a modulator in one of the paths.

to the device under test, this isn't much different than a electrically
controlled line stretcher (a classic automated load pull setup... see
the stuff from Maury Microwave, for instance)

It's a very clever technique.  A variant is used in antenna ranges where
you have a probe with a mismatch in it.

Not surprising at all.

Consider the whole black art of adjusting the input match for lowest
noise figure, which may or may not coincide with the largest output
signal for a given input.

All those theorems about matching always have an asterisk about the
assumption that they're reciprocal linear devices with constant
impedances, etc. Start putting nonideal active devices in the mix, and
life gets interesting.

Hello Cecil,

You may try to figure out how the signal injection method functions (it is a form of active load pulling).

Can you agree with:

it doesn't matter whether:
-power reflect towards the amplifier is caused by load mismatch, or
-power is sent towards the amplifier by means of a phase synchronized source.

This source is phase synchronized with the PA's exciter, so we have a steady state system.

We assume small load mismatch (or low injected power towards the PA) so that the operating point of the PA just changes slightly (to allow linear approximation).

Now we insert a coupler between the amplifier and the load. This coupler will measure the forward voltage generated by the PA, plus the reflected part of the voltage that originates from the phase synchronised source. Depending on the phase relationship, it can be more or less then the forward voltage of the PA. If the PA shows 50 Ohms, the coupler's output would not change due to the signal injection (as no signal is reflected by the PA).

We note the forward coupler's output voltage (both phase and amplitude).

Now we change the phase relationship between the exciter and the source that transmits some power toward the PA. Lets change 180 degrees and keep the amplitude the same. We again note the coupler's output voltage (both phase and amplitude).

The voltage that is reflected by the PA equals half the complex voltage change because of the phase change. Off course you have to correct the readings because of the coupler loss. If you know the signal that is send toward the PA, you can now calculate the complex output impedance of the PA for small load change around 50 Ohms.

Instead of changing the phase of the source manually, you can do that continuously and note the couplers output continuously. If you change the phase of a signal continuously (with certain constant rad/s), the result is a decrease or increase of frequency.

Assuming some reflection by the PA, the complex output from coupler rotates around a certain point. That certain point is the result of the PA's output power and the rotating vector is the result from the injected signal that is reflected by the PA (back towards the load).

With a VSA you can discriminate between the voltage component from the PA itself and the reflected component (with slightly different frequency). With a normal spectrum analyser, you can only determine the magnitude of the PA's reflection coefficient (or VSWR as you like). Given the dynamic range of today's equipment, you can inject a very low level signal that may mimic load mismatch well below VSWR =3D 1.1.

With respect to the impedance concept, we as amateurs do not use steady state signals, as they contain no information. We modulate them and are still using the impedance concept, despite the definitiones you showed.

As long as the signal that is injected is well within the pass band of the PA and it sufficiently low to allow linear approximation, the concept of superposition and concept of impedance still holds. But if you feel more confident with the manual phase change, or using two known loads with known slight mismatch, I have nothing against it. But if you have a VSA, some couplers and signal source at hand, it may save lots of time.

With kind regard,

Wim

One needs to have an analyzer with a narrow band detector for this, though.

Inexpensive analyzers like the TAPR VNA have untuned detectors, so the PA's main signal will screw things up.

The N2PK uses a form of direct conversion detector, so your test signal would have to be far enough away from the main signal so that the LPF in the detector filters it out. The original N2PK design uses, I think, a 100 Hz filter, and the adc samples at 15.36 kHz with a digital filter. The overall BW is something like 5 Hz, so putting your test signal 1kHz away would probably work.

I wonder if this should be applied to these sorts of projects -

https://www.kb9yig.com/

I have a 1 watt kit that I haven't put together yet. Several others in our club have and they love them. Especially nice for CW.

Thanks Wimpie.

It sometimes takes a bit to get me to realize this type of thing isn't
hard, it's actually simple. My old brain tries to obfuscate things from
itself sometimes.

It Calc 100. Make the difference small.

tom

Cordless phone?

Feed the signal from the cable into a modem, then into the phone
handset. Base station demodulates the audio back to digital and feeds
the cable to the scoreboard.

Trouble is, the impedance in IEEE definition (1)(B) doesn't *cause*
reflections. If the actual source impedance matches IEEE definition (1)
(B), the presumption that source impedance will *cause* a reflection
is invalid.

Walter Maxwell argues that the actual source impedance of an RF
amplifier is in reality a V/I ratio, i.e. it agrees with IEEE
definition (1)(B).

If the signals are analog and not digital, you might be able to buy a
pair of 2 gig audio/video sender units made for home TV signals. Just
use one or the other of the left and right audio input jacks. Or the
yellow video jack. You will need a mini pin to RCA adapter. The range on
those things is usually about a 100 feet or less.
It just might work.
    JFK

I have a Heath HM-2102 VHF SWR meter 50-160 MHz
0-25 and 0-250 watts. Excellent condition.

I'm *asking* $40 plus shipping.

It can be viewed at:

http://home.comcast.net/~hsknoll/site/?/photos/&PHPSESSID=29ec62ea0bf1fe4d25e318b011cf0bbf

or

http://tinyurl.com/yktwxpz   click on photo to enlarge it.

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider amending its charter, and permit limited simultaneous crossposting to rec.radio.amateur.moderated and one other unmoderated amateur-radio-related discussion newsgroup. We are currently trying this on a temporary basis (90 days, through early July 2009), and adopt it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently listed in the latest version of the "List of Big Eight Newsgroups" which is crossposted monthly to news.announce.newgroups, news.groups, and news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including

uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

Cecil suggested reading Chapter 19A in Reflections to view the results of my extensive measurements of the output resistance (impedance) of RF power amps, but except for Jim and Richard, it appears that the others have not. Actually, Chapter19A is an addition to Chapter 19, which when taken completely will provide some information that will hopefully change some minds concerning the maximum power delivered. It should be understood that 'maximum' power delivered is that power delivered with a specified level of drive.

For example, if the drive level is set to deliver a maximum of 100w, and the pi-network is adjusted to deliver that maximum power into its load, the source resistance (impedance) will be the (complex) conjugate of the load impedance. We're not talking here about the very maximum power that the amp can deliver, with max drive, max plate current, etc.

If you review the 19A portion of you will see beyond a doubt that the conjugate match exists between the output of the pi-network and its complex load impedance, and that the maximum power delivered at the drive level that allows only 100w to be delivered as the maximum.

Further review of all the data presented there will also show that the output resistance of the amp is non-dissipative, while the dissipative resistance is that between the cathode and plate. The reason the efficiency of the amps can exceed 50 percent is because the cathode to-plate resistance is less than the non-dissipative output resistance, where that R =3D E/I appearing at the output of the pi-network.

Walt, W2DU

I hope the review of my measured data will clear up some of the confusion concerning the output resistance (impedance) of the RF power amp.

Walt, W2DU

Exactly how do you determine the s-parameters for a single-port black
box? It is my understanding that an s-parameter analysis requires an

input port and an output port to be able to measure the parameters. Where is the input port on an RF source?

What you seem to be measuring is the effect of one or more physical impedance discontinuities existing in an environment of interference. Is what you are measuring the actual dynamic source impedance? If I understand correctly what Walter Maxwell is saying is that whatever combinations of physical impedance discontinuities from which you guys are reflecting your test signals, it/they are *not the source impedance* which is a V/I ratio that originates in the source. A V/I ratio and a physical impedance discontinuity do not yield the same reflection coefficients for a 2-port device.

I used a 2 port VNA frequently for antenna measurements, with the
difference that a single port calibration takes less time than a full
two port calibration.

I would recommend you to measure something yourselves, or put it into
a simulation. You will see that it doesn't matter whether you use a
deltaV/deltaI setup (complex values, not magnitudes) or reflection
(time varying phase of VSWR) measurement. Just try to explore other
paths and discover other insights.

It doesn't matter when you are measuring a single port device that
contains a generator in it (as long as your VNA setup is able to
distinguish between the output generated by the single port device and
the reflection towards the VNA).

There is similarity with measuring antenna impedance (single port
measurement) when close to (broadcast) stations. Your antenna is a
generator in that case. You can't use the non-coherent type of VSWR
analyzers as the detector detects the signal from the broadcast
station also. However when using a device with a coherent

(multiplying) detector you can, as the detector doesn't respond to the output because of the (broadcast) station.

With Tom's HP89410 setup, the injected signal for S11 can be well within the modulation bandwidth of SSB (that means well within 1 kHz of the transmitter's carrier frequency).

When you have good understanding of diode detectors, you can even do it without a VNA by using heterodyning and put your focus on the phase and amplitude of the beat frequency.

With kind regards,

Wim

Please take a look at the numerous measurements performed by Walter Maxwell.

Let's take a simple example of the single-port s-parameter results. There exists a black box with one exposed port. The impedance is measured to be 50+j0 and s11 is assumed to be zero when driven by a 50 ohm source. There could be a 50 ohm dummy load in the box but there is not.

Actually, inside the black box is a 1/4WL Z0=3D100 ohm transmission line routed to a 200 ohm resistor. s11 is certainly not zero and is measured, using the 2-port procedure, to be 0.3333.

Which s11 is correct, 0.0000 or 0.3333?

Hello Cecil,

Assuming that your black box is a 100 Ohms quarter-wave line with 200
Ohms termination (all inside the black box), S11 (50 Ohms based) =3D 0,
as the input impedance of your black box is 50 ohms. If you like, you
may see your room temperature black box as a source with about =96174dBm/
Hz output and an output impedance of 50 Ohms.
```

Wim

.

This is what happens when one changes math models in mid-stream. s11
is NOT zero at the mouth of a stub. The impedance looking into a stub
is IEEE definition (1)(B) and cannot have an s11 of zero unless the Z0
of the stub is infinite, which it is not.

Thanks for proving my point. The single-port s11 is completely different from the dual-port s11 and that is most likely what is happening with your attempts to measure the source impedance of an RF amplifier. How can you possibly promote an experimental approach where s11 changes by an infinite percentage depending on whether one measures it as a single-port parameter vs a dual-port parameter???

From your text I didn't conlude it is a stub (but just a series line section that transforms 50 OHms into 200 Ohms).

Please explain (or someone else), as I don't understand anything of the above with regards to a PA. You described a single-port device and now starts talking about a two-port device.

If you want to prove that for a two port device the impedance corresponding to S11 may not be equal to the input or output impedance of port 1, you are right. When S12*S21 isn't zero, the input impedance depends on the termination of port 2. This is just S-parameter math, nothing magic.

For the PA case, the active device is the termination for the two-port matching network, so in that case S11 measurement equals the input/output impedance of the PA (just a single port measurement). See it as the output impedance of the active device is connected to port 2 (of the matching network), and the VNA (or load) is connected to port 1 (that is the output side of the matching network).

The PA reduces to just a single-port network with a source in it (compare it with the antenna example where a transmitter is in the vicinity). As long as the injected signal (or slight mismatch connected to transmission line with increasing length) is small, you can apply the small signal approach.

As suggested earlier, you may dive into active load pulling:
http://www.focus-microwaves.com/template.php?unique=3D232

It doesn't matter whether you show some mismatch to a PA, or a perfect matched load with a small source in it representing the signal that is reflected towards the amplifier.

When a source is tuned (e.g. through a pi network or any other matching network between a PA and its load) such that maximum power is delivered to the load, it's axiomatic that the source impedance is the complex conjugate of the load. Is there really a need for a whole chapter for that?

You say, "We're not talking here about the very maximum power that the amp can deliver, with max drive, max plate current, etc." I beg to differ. That is EXACTLY what we are talking about. We're talking about modern amplifiers that would be destroyed if not for protection circuits, if they were loaded with a load that resulted in maximum dissipation in the load. We're talking about even old amplifiers with enough grid drive that they COULD be loaded to higher power output, but for reasons of wanting the active devices to survive for a reasonable length of time (or possibly other reasons), are not loaded so heavily. If you want to exclude such amplifiers from consideration, then I would hope none would disagree about the relationship of the load impedance and the source impedance. You needn't have made any measurements to convince me of that.

Cheers,
Tom

If you recognize the example as a two-port device, you correctly
measure an s11 of 0.3333, (100-50)/(100+50). If you happen to overlook
the second port to which the 200 ohm resistor is attached and treat
the example as a single-port device, you measure an s11 of 0.0000,
(50-50)/(50+50). The example has not changed between those two
measurements so which s11 is correct? Doesn't that fact give you pause
to wonder if you are making essentially the same mistake with the PA
measurements?

You want to know the output/input impedance of your black box, this
means you should look into the 100 Ohms line with 200 Ohms
termination. We will see 50 Ohms, no matter the reference impedance of
the VNA. If it was a 75 Ohms VNA, it would read S11 =3D -0.2.   What the
200 Ohms resistor sees is not important if you just want to know the
behavior of the single-port black box.

> Doesn't that fact give you pause to wonder if you are making essentially=
 the same mistake with the PA
> measurements?

I am very sorry Cecil, but I still don't see the point where the discussed method may go wrong.

The only thing I could think of is that you have in mind a setup where the input of the PA is port number 1 (and the output is port number 2) and you carry out a full-port measurement. For a full class-A, AB, non-saturated PA, this may give useful results. When S12*S21 << 1, S22 will equal the output impedance, otherwise you have to do the match.

In real world many amplifiers do not behave as a linear system (food for discussion) and then the two-port setup will fail, as during S22 measurement the input port is terminated with 50 Ohms (so there is no source that provides output).

Therefore carrying out a single-port measurement with a slightly off-carrier frequency (to create non-coherence) under required output conditions, will result in a meaningful output impedance. As mentioned before, doing a (slow) manual load pull measurement may give different results because of bias and supply voltage variations.

On May 2, 5:23=A0pm, Wimpie <wimabc...@tetech.nl> wrote:
> I am very sorry Cecil, but I still don't see the point where the
> discussed method may go wrong.

Everyone seems to be charging ahead, willy-nilly, without seeing the point which is that there are other effects present besides reflections.

> Therefore carrying out a single-port measurement with a slightly off-
> carrier frequency (to create non-coherence) under required output
> conditions, will result in a meaningful output impedance.

Nope, it won't because virtual impedances don't cause reflections. Only physical impedance discontinuities cause reflections. The rest of the redistribution of RF energy is caused by the superposed interaction between forward and reflected waves, i.e. interference effects. Most hams do not understand the role of interference in the redistribution of RF energy. Hope this helps.

http://micro.magnet.fsu.edu/primer/java/scienceopticsu/interference/waveint=
eractions/index.html

Please pay close attention to the last paragraph. "... when two waves of equal amplitude and wavelength that are 180-degrees ... out of phase with each other meet, they are not actually annihilated, ... All of the photon energy present in these waves must somehow be recovered or redistributed in a new direction, according to the law of energy conservation ... Instead, upon meeting, the photons are redistributed to regions that permit constructive interference, so the effect should be considered as a redistribution of light waves and photon energy rather than the spontaneous construction or destruction of light."

You guys are presuming that reflections are the only thing you are
seeing and that is just not true. You are also seeing interference
effects without realizing it so your conclusions are doomed to failure
unless you can differentiate between constructive/destructive
interference and reflected waves. Since there has been no mention of
interference effects, I am forced to conclude that you guys are
ignorant of such effects.

Not necessarily..

Advertising runs as "cost per thousand" (aka CPM) based on the circulation of the magazine. The CPM for QST and QEX is probably pretty close (same target market and all that).. You could probably find it on the rate card which is on the ARRL website somewhere.

Let's say the rate is $1/thousand..

So, for a given size ad, QST may have, say, 150,000 copies, and QEX may have 1500. So ARRL would get $1.50 for an ad in QEX, and $150 for the same ad in QST.

Printing costs are pretty much the same, per copy, per page. However, the other production costs (editing, copy, pre-press) are fixed, regardless of how many copies you print. So for QST, the "per page per copy" cost is a lot less.

QST is probably MUCH more profitable than QEX.. lower cost to print a copy, more revenue to collect per copy.

For reference, the QEX ad rates are $155 for 1/6th page up to $733 full page. NCJ is 412/page, 78/sixth

I couldn't find circulation numbers for any of them, and no published rate card for QST. (I assume QST has lots of "multipage discounts", for instance).

I'm basing this opinion on the ARRL budgets that were published in QST
about 20 years ago. They currently (still) claim they are there for
mainly 2 things, protecting our rights and privileges as operators and
adding new operators through education and other methods. Unless they
have gotten rid of all the bits they used to have that they didn't need,
they are still spending between 2 and 5% of the money they collect on
what's supposed to be the main goal.

Where does all the rest go? Read the budgets if they still make them
available.

Charlatans then, are they now? I don't know. And don't care. They
lost me.

tom

I think if you have a noisy one, you have reason to complain -- and
get satisfaction.  I used to work in a US Navy office building.
Although "domestic" doesn't apply, it did have a large PV array
installed.  After it was running, I took a portable AM radio on the
roof and I had to get within inches of the array to get any hash at
all.  I swept the dial to be sure; also walked around to check several
places.  Sorry, the controller equipment was locked away.  No close-up
test possible.

By contrast, I use a small switching PS for my 220 handheld on our
local Net Night. If I don't unplug it, I'm reminded by my S-meter as
soon as we move to HF.  It is one noisy, little bugger.

Pretty well identical with the UK situation. The RSGB have lost many,
many members for these reasons - including me.

tom, just my personal opinion, but too bad you left the ARRL and too bad
you don't care.

I don't know about your "2 to 5%" figure, but even if it is true, it's
exactly 2 to 5% more than any other organization is spending to go to
bat for ham radio...and IMHO, we NEED (and should support) a national
organization.

73,
Joe

Several Saints say,
"You live in a time wherein it is of
Great Importance that many people
understand that the Gift of human living
is a Gift far greater than it is often
understood to be. So much is taken for
granted and even passed over, not seeing

or not realizing the value of what life was created to be, to have, to follow and to one day be known for."

REVELATION DELIVERED THROUGH FRANCES M. KLUG
ON DECEMBER 5,2006 AT 12:17 P.M.

SEVERAL SAINTS

"There are Several of Us with this little one as there so often is, but We are making a point of it today because of all she has endured up to this time.

You live in a time wherein it is of Great Importance that many people understand that the Gift of human living is a Gift far greater than it is often understood to be. So much is taken for granted and even passed over, not seeing or not realizing the value of what life was created to be, to have, to follow and to one day be known for.

There is so much We want to talk about through this little one because she is Our Method, Our Means, and Our Love to be able to speak through her and have her repeat What We Will others to hear, or to see, or to acknowledge, or to learn about.

Thank you for taking My Notes, because They were meant to not awaken you, but alert you to the Importance of Those of Us Who surround this little one more times, more ways, than it is ever understood to be."

Saint Joseph's Hill Of Hope
Brea, California 92822 U.S.A.
www.TheMiracleOfStJoseph.org

Why? If every ham just wrote to their elected officials (for the cost
of a stamp, or free by email), they would get the message just as well,
if not better than, if they got 1 letter or a personal visit from the
ARRL "lobbyist".

Just my personal opinion, but I believe it is quite naive to think that
if "every ham just wrote". Extremely unlikely...and oh, if not the ARRL,
just who do you think is going to tell the hams to write and what to
write about?

Finally, it's quite naive to think that a national lobbying organization
is not helpful -- just look at how successful the NRA is.

All of you are also forgetting that the ARRL (for better or worse) is
now the 'back bone' of the system that handles testing for ham licenses.
 Without them it would be almost impossible to find where you can
locally take the test to apply for or upgrade your ham ticket. The ARRL

also publishes most of the test guide material (though I would be
surprised if it wasn't also available on line). Finally they have a
good line of excellent technical publications on radio and electronics
technology.

Also they DO offer membership without QST, for additional members of a
family. Maybe the price of that will give you an idea of what they
think the membership itself is worth.

Yes, and the blind can get a membership without QST for $8, same as a
family member without QST. That was where I got my number from in
another post in this thread.

Again, I am not suggesting anyone give up their membership in the ARRL.

The ARRL seems to have little to do with the most important part of getting new hams, licensing.

The National VEC page, http://www.ncvec.org, apparently doesn't even
acknowledge the ARRL.

You have to search the site and get to Question Pool 3 to find the first
hint of the ARRL, and it's an email address for WY1O, who seems quite
dedicated and appears several more times. And he's all there is.

So much for making new hams.

tom

Well, if hams won't take any initiative to write their Congressmen, then they probably don't give two craps enough to really care if we lose bandwidth. All proposed NPRMs are published in the Federal Register and a simple search on their website for "FCC" will list them.
http://frwebgate.access.gpo.gov/cgi-bin/multidb.cgi

>
> Finally, it's quite naive to think that a national lobbying organization is not helpful -- just look at how successful the NRA is.

So, the ARRL is donating how much to political parties?

The NRA has donated a bit over $18 million from 1989-2010. They were number 39 of the top 140 donors...
39 National Rifle Assn $18,209,746   17%(To Dems) 82% (To Repubs)
THAT'S probably why they are so successful. Money talks, BS Walks...

http://www.opensecrets.org/orgs/list.php

Didn't see the ARRL in the top 140. Searched and didn't find them on the list at all. #140 donated about $4.7 million over the same period.

If the ARRL is so successful at lobbying, why did BPL go through even though they begged members to send more money to fight against it and lost the battle anyway? Remember when the 13cm band used to be 2300-2450 MHz? I do. Remember when the 1.25M band used to be 220-225

MHz. I do. Remember when a lot of foreign countries had no code requirement for HF and we did? I do.

I'm not saying they aren't worth something, but why won't they give a guy a choice about which magazine he wants with his membership? Probably because QEX doesn't have so many ads as QST and they want the advertisers to get more bang for their buck (understandably, since they can charge more for ad space based on the number of magazine "subscribers")

Don't forget W5YI as a VEC.  That's who I'm affiliated with, although
I'm not active with any VEC at present.  They list VEs by state, so you
can find a local examiner.
http://www.w5yi.org/exam_locations_ama.php

  The ARRL also
> publishes most of the test guide material (though I would be surprised
> if it wasn't also available on line). Finally they have a good line of
> excellent technical publications on radio and electronics technology.

Yes, so I would almost say they are more in the publishing business than
the lobbying business.

>
> Also they DO offer membership without QST, for additional members of a
> family. Maybe the price of that will give you an idea of what they think
> the membership itself is worth.

So, can I just pay for membership and skip QST?

I believe they are required by the IRS to set a "value" on membership if
they are a non-profit.  They are a non-profit, aren't they?

Huh? It's really not clear what you are saying. Have you visited the
ARRL web site?

Here are some of the sections they have listed relating to developing
new hams under the "Licensing, Education & Training" tab:

*FCC License Info & Forms

ARRL can provide helpful FCC information about licensing requirements, forms, fees and regulations.

*Getting Licensed

Get the information you need to get started: find a class or study materials and prepare for your licensing exam. Already licensed? Take the next step and upgrade.

*Volunteer Examiner Coordinator

The ARRL Volunteer Examiner Coordinator (VEC) offers resources for finding an exam session, becoming a volunteer examiner and VE Team support.

*Volunteer Instructors/Mentors

*ARRL Courses & Training

ARRL training materials and online classes have been developed to help you learn at your own pace.

*FCC License Info & Forms

ARRL can provide helpful FCC information about licensing requirements, forms, fees and regulations.

*Get on the Air

You've got your license, now what? Find resources to help you set up your first station, get on the air and have fun! Learn More

Volunteer opportunities, recruitment and unique ways to support Amateur Radio advocacy.

- o Amateur Radio in the Classroom

This sure seems like a lot of stuff for a group that you claim is not supposed to be interested in beginners.

> The National VEC page, http://www.ncvec.org, apparently doesn't even
> acknowledge the ARRL.

Again, huh? This site is "unto themselves". They don't seem to acknowledge ANY group except themselves. Sorry, but IMHO, a totally bogus point.

> So much for making new hams.

One more time...Huh?

They DO have a VE program (I AM one), they have an Educational program to bring ham radio to kids in the class room, they set up space station contacts for kids in classrooms, they have a Volunteer Instructor program to teach people how to be instructors for training new hams, they have volunteer mentors, almost every article in QST has a "Hamspeak" section to explain unique ham terms to beginners.

Finally, what makes you think they don't want new hams? It would be in their best interest and longevity to have more new hams. Why would they shoot themselves in the foot by not wanting new hams?

The only thing that IS clear to me is that you have not read QST in a long time, have not been to their web site in a long time and seem to have a real grudge against them for whatever reason (certainly your prerogative). But you DO demonstrably have your facts wrong about them doing nothing to encourage new hams.

I would respectfully suggest that you visit their site, arrl.org, and at the main page choose the "Licensing, Education and Training" tab to see just how much they ARE doing to cultivate new hams. (Admittedly a tough job in the Internet Age, but contrary to what you are saying, they ARE trying).

73,
Joe

IF The ARRL want to have a real "Voice" at the Table
in Congress and at the FCC :Then they have to be as
'smart' as the other "Players" in the Washington, DC
Political 'Action' {Power} Game.

Look At Success : Look at the NRA Political Victory
Fund (NRA-PVF) : http://www.nrapvf.org/

You have and build your 'basic' ARRL Membership
-roughly- 155,000 ARRL Members
http://www.arrl.org/membership

+ Plus you have to have and build a supporting
{Independent} "Voice of Amateur Radio" PAC Fund

The ARRL has enough Members who are Lawyers
set-up and make a "Voice of Amateur Radio" PAC
Fund Do-Able and Work-Able -so- Just Do It !

Encourage Each ARRL Member to make a
Matching {Voluntary} Contribution to the
"Voice of Amateur Radio" [VoAR] PAC Fund
-so- Take the 155,000 ARRL Members
-by- $5 =3D $775,000 VoAR-PAC Fund : Figure about
20% for a Part-Time Lobbyist and leaves around
$1000 in 'political' contributions per Member of Congress
-by- $10 =3D $1,555,000 VoAR-PAC Fund : Figure about
20% for a Part-Time Lobbyist and leaves around $2000
in 'political' contributions per Member of Congress

? Is Your Amateur [Ham] Radio "Hobby" Worth an
Extra $5 to $10 per Year To You For A Seat At The
Table of Congress and the FCC in Washington, DC ?

Promote the "Voice of Amateur Radio" PAC Fund
to the American Public and the Corporate World
Git Them To Become Sponsors and Underwriters
of the "Voice of Amateur Radio" PAC Fund too.

Then Use the "Voice of Amateur Radio" PAC Fund
Money to Lobby Congress and the FCC to ensure
Fairness and Equal Treatment for Amateur Radio
in Congress and Before the FCC.

It's All Legal & It's All Good - it's very smart too ~ RHF
 .
REALITY CHECK : WITH ONLY 155,000 MEMBERS
THE ARRL HAS THREE GOALS :
1st : Build Membership and Increase the Number of Hams
-or-lose-spectrum-and-vanish-from-the-air-waves-
2nd : Build Membership and Increase the Number of Hams
-or-lose-spectrum-and-vanish-from-the-air-waves-
3rd : Build Membership and Increase the Number of Hams
-or-lose-spectrum-and-vanish-from-the-air-waves-
 .

The NRA has spun off an entire "separate" organization to do that, since
the tax status of the basic organization doesn't allow it.

The NRA also has about 4 million members; how many does ARRL have?

BPL has NOT "gone through."

The ARRL DOES lobby in D.C. - Chwat & Co., Alexandria,VA
Plus direct HQ access to the FCC commissioners and staff.

Your contributions are regularly requested, plus the most effective,
personal letters to our representatives.

"non-profit" organizations do have restrictions on how money is spent,
e.g. no money to political campaigns, etc.

- BPL has NOT "gone through."
-
- The ARRL DOES lobby in D.C. - Chwat & Co., Alexandria,VA
- Plus direct HQ access to the FCC commissioners and staff.
-
- Your contributions are regularly requested, plus the most effective,
- personal letters to our representatives.
-
- "non-profit" organizations do have restrictions on how money is
spent,
- e.g. no money to political campaigns, etc.
-
- http://www.arrl.org/regulatory-advocacy
-
- W5MTV

W5MTV --- Hence "Look At {Better} Success" :
Look at the NRA Political Victory
Fund (NRA-PVF) : http://www.nrapvf.org/

The Are More and Bigger Challenges To Amateur Radio Then
Just BPL : Such As Lose of RF Spectrum and Radio Bands.
http://www.arrl.org/files/file/Hambands_color.pdf

Simple Fact : With just 155,000 Members the ARRL
is a relatively 'small' Constituency Group for anyone
Congressman or Senator; and the US Congress as a
whole; as contrasted to :
* NRA ~ 4 Million Members [25X ARRL]
* AARP ~ 40 Million Members [250X ARRL]
Both of Which Claim To Be "Non-Profit" Organizations too...

Again I Simply Posse The Question :
Why-Not ? : A "Voice of Amateur Radio" PAC Fund !

What hams need are wealthy, high-profile members - like the NRA and
AARP. They may be small, but fascinating people, even if they are
stooges, can yield results.

So you need a dozen younger Barry Goldwaters ?
  or a 2nd organisation same as here because the incumbent are hopeless

Government for sale to the highest bidder?... typical stupid teabagger

Teabagging republicans would sell their mother's SS to the rich while
living under a bridge burning the corpses of the children they fought so
hard not to abort and brag to each other about their perceived superior
intellect on their new 400Mhz cellphones.

My idea is to make some sort of hinge so I could lower it over and raise it. I know I mentioned it before but now seems to be the time I need to do it. (My little boy is starting to find pieces of the antenna in the yard.)

My thought was to dig a hole beside my current antenna a couple of feet deep and in circumfrence. Place some 3 inch schedule 80 pipe (one for each corner) into the holw with a 2x2 or so piece of 1/4 inch steel on top. On the end of the plate would be welded a few pieces of black pipe the diameter of a hitch pin. There would be another piece of 2x2x1/4 piece of steel with more black iron pipe on it. The black iron pipe would in effect be the "hinge" part of the mechanism. (sort of the way I made the fold down gate for my trailer).

Here is where I am having trouble. On top of the "top" plate, I have some 2 inch black iron pipe. My first thought is two weld three of these as "legs" on top of the top plate, then put my cut down exisiting tower into this pipe, drilling a hole through each leg. (The new two inch pipe and the legs on the tower). Instering a grade 5 bolt into this. I have also thought, I wonder if it would be easier to

just
put the three legs up and use u bolts to attach the tv tower to the
outside of the legs.

I would still need to climb part way up it or have the capability to
to adjust my sat dish. I cant figure out a good way to do it with the
tower leaned over.

Google "fold over tower" or "hinge base tower" to see what the rest of
the world does.

Really cant get my head wrapped around most of the discription but two
feet in the ground for the supports probably isnt enough. We have a
30ft tower at work with a pretty light load Omni UHF antenna and it is
8 ft in the ground.

Jimmie

I assume you meant " part way up to have ...", so I'll offer an approach to the satellite dish portion: You can make a very accurate angle finder, irrespective of whether the tower is upright or tilted. I did it virtually free.

Photocopy a protractor or print an Internet graphic of one and paste/ tape it to a smooth flat surface. For mine I used a waste chunk of half-inch pine and the size -- 180 degrees' worth of arc -- is about ten inches. I printed it up to that size on standard paper.

Paste the protractor so the vertex (the point from which the angles originate) is on one edge of the board. Hang a weighted string from the vertex. (I used dial cord; it's strong, smooth and thin.) When the board is held vertical, the angle of the top or bottom edges of the board are indicated by the angle mark crossed by the string.

The string is only a tenth of a degree wide so you figure I can set angles pretty well using this crude, clunky device. (I used it to install a C-band dish in the 1980s; I got elevation perfect the first time and azimuth within a quarter-degree.)

Given that one picture is worth a thousand words, I have a graphic I

```
drew.  I'm having trouble uploading it to my web provider but I will
email it to you if you like.  You can post here or directly email your
interest to me at the "sobars" email address you see for me at
cox.net.

73,
"Sal"

I have obtained mastery over my Internet provider and their
sucky software.

http://members.cox.net/markhamjf/ham/Cheap_Inclinometer.jpg

is my graphic of the angle finder. I called it an "inclinometer."

Enjoy,
"Sal"

Call a fiberglass place and get a cheap resin/hardner and fill in the center.
Anything you don't want it to stick to, use vaseline. A pint of the r/h should do
it.

I might be asking my question in the wrong group, so feel free to send me packing if I am.

The background:

Our high school just installed a scoreboard for our new Varsity Softball field. The scoreboard controller talks to the scoreboard via a cable that has a 1/4" TRS plug on each end.

http://www.planetronic.es/images/ak2563.jpg

One end plugs into the controller and the other end plugs into a jack that is wired to the scoreboard in the outfield.

Unfortunately, they didn't ask anyone involved with the team which dugout would be the home dugout, and they installed the jack that the controller plugs into in the visitor's dugout.

We are currently using a 20' cord so that the operator doesn't have to sit in the visitor's dugout...he sits outside the dugout, but is still on the visitor's side of the field.

We'd like to move the operator to our dugout, but we can't get the school to move the jack until after the season is over.

The question:

Could we use a wireless transmitter and receiver in place of the cord? If so, we could put the receiver in the visitor's dugout and plug it into the socket and the transmitter would plug into the controller. The range would be under 100' and the dugouts are made of concrete.

The problem is, I don't know where to start looking for this type of equipment, or even what I would need to know to spec it out.

Any suggestions would be appreciated.

Thanks!

This group is about antennas used in the Amateur Radio service, aka ham radio.

Why not just make a 100-foot cord for the controller?

Thanks for the response.

While the straight line distance is about 100', the physical distance
for a cord would be about twice that in order to go around the backstop.

Then there's a walkway to deal with, players with spikes, etc. While a
longer cord will certainly work, I'm just wondering about alternative
solutions.

You need to find out what kind of signals are carried over the cable?
Is it some sort of serial data (very likely)? If so, then you should be
able to find some sort of wireless data link that can handle the data
rates and formats.

What does the scoreboard manufacturer offer? (This has to be a
reasonably common problem..)

This group has presented members with valuable lessons in antennas and
transmission lines, like how to measure, how to match, etc.

Something I haven't seen is a discussion of the source impedance of
the transmitter. My curiosity was piqued today as I took some baby
steps into EZNEC. A particular antenna had such-and-such VSWR if fed
with a 50-ohm cable and a different value if fed with a 75-ohm cable.

While this is hardly news, it got me wondering whether a 75-ohm cable
will load the transmitter the same. Doesn't seem like it.

My point: Using 75-ohm cable to improve the match at the antenna
won't help me ... IF ... I suffer a corresponding loss due to
mismatch at the back of the radio. My HF radios, all solid state,
specify a 50 ohm load. As necessary, I routinely use an internal
autotuner and either of two external manual tuners. (I'm aware of the
published 1/12 wavelength matching method.)

Wisdom in any form would be appreciated. Thanks.

"Sal"
(KD6VKW)

A transmitter output impedance is designed for maximum power transfer at a specific impedance. Most of the the older tube transmitters impedance was tunable within a range.

In simple terms the impedance of the transmitter tube is the plate voltage devided by the current. This impedance is then transformed to the nominal 50 ohms of the antenna system. If the transmitter has the usual tune and load controls, the exect impedance will not mater as you adjust for maximum transmitter output.

Most of the transistor transmitters are not adjustable so the output impedance is usually fixed at 50 ohms for maximum power transfer. If the impedance of the antenna system is not 50 ohms, then the output power will be less than the designed output. You can use the antenna tuner to adjust for a match.

I suspect that most ham transmitters do NOT have a 50 ohm output impedance. What they do have is a specification that they will adequately drive a 50 ohm load (and some sort of internal circuitry that detects an "unacceptable" output condition and turns down the drive).

After all, your transmitter could have an output impedance of zero ohms (a "stiff" voltage source), and adequately drive your transmission line and antenna at 50 ohms (yes, this is not the optimum power transfer, but nobody ever said that ham transmitters are designed for optimum power transfer... maybe they're perfectly happy with less transfer, but still operating within their safe area)

ON9CVD made some simple measurements using a couple of resistors and foudn that a TS440 has a Zout somewhere around 15-40 ohms (depending on frequency and output power).
http://sharon.esrac.ele.tue.nl/~on9cvd/E-Uitgangsimpedantie.htm

>mismatch at the back of the radio.

Hi OM,

Look at the prospective SWR and how much is lost/reflected/absorbed/what-have-you? More heat comes from a less

than optimal system efficiency than what your computation will reveal.
So much that it will swamp it.

But the trick here is that the reflected "power" (arguments turn on this word) doesn't always mean heat and it could actually cool - however hot or cold it may alter the situation, that same "power" never got out into the air.

Now, as for source impedance, that is a subject fraught with denial in the face of the obvious: Those fins in the back of your rig are to help bookend your QSL cards into groups (the heat bears no relation to efficiency nor match loss).

A standard definition (courtesy of Wikipedia) for Return Loss is:
where Zs is the impedance toward the source and
Zl is the impedance toward the load.
and we find from the values you supply that it is
0.20

Of course, such a definition is utterly useless when the concept of Zs is replaced with (in most cases) "it ain't 50 Ohms, thet's fur shure").

If, perchance, some brave soul steps into the breach of NOT 50 Ohms to suggest what Zs is, then we can give it the acid test of engineering (an act that I am usually reminded is beyond the understanding of readers and the province of discussion here). Let's be gentle and go only by an order of two (which is reasonably available and can be coaxed out of my TS-440). Return loss for a rig exhibiting an Zs of 25 Ohms into the 75 Ohm line (presuming it is infinite in length) would give us:
0.50
that doesn't look good, so let's try Zs of 100 Ohms:
0.14
that looks better all 'round. Even intuition agrees.

Let's press intuition to the proximal limit and say that Zs is 74 Ohms (yes, my thumb is on the scale):
0.01

What does intuition affirm? What is preferable?

73's

Hello Sal,

Make yourself up for a long discussion (as we had such a thread earlier).

Most amplifiers are designed just to provide the desired amount of power into a certain load. The actual output impedance of the amplifier is not important in many cases. Changing the load impedance (for example in case of a solid state amplifier) may result in less or more heat generated in the active device(s).   You can see this by changing the load (for example with an external matcher between power meter and PA) and watching the output power and current consumption.

If you have an amplifier with tunable output section (vacuum tube PA), you are within the range of the tuner, and you tune it for maximum output power (given certain drive), the output impedance equals the load impedance (or conjugated value in case of non-ohmic load). If you change the drive (so adjust the output power), the output impedance may change (due to saturation issues). Same is valid for the load, if you change the load, voltage across and current through the active device may saturate, hence changing the output impedance.

Non-tunable amplifiers (for example a 3=8530 MHz balanced amplifier) will mostly not present 50 Ohms to your load (unless specially designed for that using feedback).

Virtually all high-efficient switching amplifiers do not show 50 Ohms to the load. If you add an external tuner and match to maximum output power, you will very likely destroy the amplifier in case of no supervisory circuits present.

You can do some experiments with your own amplifiers. Just change the load impedance and see what the forward power indicator on your reflectometer/VSWR meter does. If it doesn't change, your output impedance is very close to 50 Ohms.

Measuring the output impedance (for relative small change in load) is possible, but is not a simple task. Very likely other people will comment on this.

With kind regards,

Wim

Changes followed by "|".

The rec.radio.info newsgroup, first established in 1993, has been recently revived by an active moderation team. We are currently seeking suitable information, FAQ, and bulletin articles from the entire rec.radio.* newsgroup hierarchy for simultaneous cross-posting to our newsgroup.

We are seeking a replacement maintainer for the following information bulletin formerly posted to rec.radio.amateur.* (and currently archived at http://www.faqs.org/faqs/radio/personal-intro/):

radio/personal-intro
Subject: Guide to the rec.radio Newsgroups
Maintainer: jeffreyh@Hawaii.Edu (Jeffrey Herman)
Last Posted: 9 Nov 2001 06:18:17 GMT
Posting-Frequency: 15th of each month

One significant omission, requiring immediate updates, for this article |
is that it does not mention newer amateur radio newsgroups created since |
it was written, including: |

rec.radio.amateur.antenna |
rec.radio.amateur.boatanchors |
rec.radio.amateur.dx |
rec.radio.amateur.equipment |
rec.radio.amateur.homebrew |
rec.radio.amateur.moderated |
rec.radio.amateur.space |

We are willing to provide any technical support necessary to get this article updated and automatically posted again at a regular interval. This would include establishing contact with the original maintainer for any necessary permissions. We would prefer to seek a new, dedicated maintainer at this time, rather than start auto-posting the original article ourselves.

For more information about our newsgroup, see:

http://www.panix.com/~rram/usenet/rri/index.html

Please direct any comments, questions, or criticisms to
rec-radio-info-request@panix.com.

All real waves are asymmetric. For this reason they transport mass.
>

I prefer Faraday's idea. No aether. In space is the same as in metal.
Wibrating ions and electrons.

>.. it simply can be made to "vibrate", like water vibrating in place and
>creating waves which transverse the pond ...

In aether model aether vibrate and particles "are in place". In Faraday's
model particles vibrate and no aether between them.

> The ether/wave model is the only model which can, and in quite simple
> terms and design, account for waves transversing non-empty space (a vacuum

In real space no aether but ISM (rare plasma + dust).
>
> All other models which have been constructed require elaborate
```

> explanations and examples which are only imaginary in existence (no direct
> physical examples can be had/seen.)

The same speed of electric disturbances in copper and light in space was the physical examples for the idea "no aether but vibrating particles".
"I suppose we may compare together the matter of the aether and ordinary matter (as, for instance, the copper of the wire through which the electricity is conducted), and consider them as alike in their essential constitution; i.e. either as both composed of little nuclei, considered in the abstract as matter'. From: http://www.padrak.com/ine/FARADAY1.html

In above Faraday use the word aether but he explains what it is made of.
Today we say space. Space is filled with ISM.

but in vibrating particle waves like sound waves the speed of the wave
is very dependent on the density of the material.  with sound waves
the waves travel faster in dense material, compare the speed of sound
in air and a metal bar.  with electromagnetic waves that is backwards,
they travel slower in dense material and fastest in a vacuum.

Thank you for the response, folks. I appreciate it.

........and OUCH!!!.......

The swr is higher than I had hoped for. I was hoping to use a duo-band 15/40 meter wire dipole that could be fed directly with 50 ohm coax connected to my Yaesu FT-450AT with internal tuner.

But the FT 450 AT internal tuner will only match up to a 3:1 swr, so that won't be "do-able".

Thank you again......

See QST Dec. 1991 Hints and Kinks. The author cut the dipole for the
low end of 40M~67' and used a Q section of RG59 cut for 21 MHZ to
improve the match on 15M.

Yes, well, there is no such thing as an "empty box." In such a box, all
the sides end up compressed against each other, obviously.

>

>>

Yes, I see, "something floating in nothing." All I see is an impossibility.

Ether severs another import avenue to explain another observed phenomenon. How two particles can exist at the same place, at the same time -- ether is the medium transporting the information so that this becomes quite possible. Even makes the concept of time travel theoretically possible, indeed, being in two times, at the same time only appears as a possibility which exploits the same phenomenon.

Regards,
JS

Air is floating in nothing. But between the air molecules are ions and
electrons. In the space the proportions are different than in air.

And, I favor Einstein and the gravitational aether.

However, I am hoping CERN, when in full swing, will start churning data which tosses the truth to one side, or another ...

Often, a search for one thing/phenomenon/effect/affect/etc. will, quite surprisingly, answer a totally different set of questions in an obtuse angle to the intended direction of the original questions.

Anyway, I can always hope ...

Actually, if you extrapolate the most likely possibility of what ether is, it is most likely, the smallest possible particle of what all matter is made/composed of.

And, because of the obviously, most extreme diminutive size of these particles (which ether is), the ether particles exhibit properties/qualities which do not even "see" these larger constructs of itself ...

I always use an odd number of segments, and the middle segment is where I feed it. The voltage source is essentially in series with the segment, and if your segments are short enough, the current distribution

along the segment is effectively uniform, so it makes no difference.
OTOH, I'm running NEC4 with a lot of memory in double precision, so
using hundreds of segments isn't a big deal.

I think it *will* work (based on practical experience.. I've done this a
bunch of times).. you just need to fiddle with the length to get an

acceptable match in both bands. And, of course, you're not going to get
something which matches the bottom of one band and the top of the other.

People fling up dipoles (theoretical feedpoint Z around 70 ohms) and
feed them with 50 ohm coax all the time and never give it a second
thought. (partly that's because rarely is the dipole perfectly flat..
if it droops or peaks up, the Z gets closer to 50 ohms)

I agree, it may very well work acceptably. I've been able to get a similar 40-meter wire to match up OK on 15 meters, using the autotuner built into my Kenwood TS-2000.

Another option would be to add some sort of matching element, either at the antenna or at the rig, which would bring the feedpoint impedances on both bands to within the ranges acceptable to the rig's internal tuner.

If the antenna is close to 50 ohms resistive in the 40-meter band, and is around 85.26 - J 186.3 in the 15-meter band, then you could consider adding a series coil at the antenna feedpoint. If I'm doing the numbers right, an inductance of 1.5 mH at the feedpoint would cancel out the 186 ohm capacitive reactance almost exactly, leaving you with an 85-ohm resistive impedance or an SWR of around 1.7:1, which should be quite easy to drive.

This much inductance would change the feedpoint Z on 40 meters to around 50 + J60, so the SWR would be quite a bit more than 1:1... probably still within the range of your tuner, though.

Several ways to deal with this:

- Compromise, by using less series inductance... maybe 1 uH - this wouldn't lower the SWR on 15 meters as much, but would raise the SWR on 40 meters less. Calculate and fiddle a bit and you can probably find an inductance which will result in similar (and very comfortable) tuning SWRs on both bands.

- Instead of a plain L at the feedpoint, use a series LC - one which is series-resonant at 40 meters (thus adding no reactance and not changing the SWR at all) and has a net reactance of J186 at 15 meters.

All of these techniques will narrow the SWR bandwidth on 40 meters somewhat, but with care you should end up with an easily-tunable antenna.

This request from last year did not garner many specifics other than that one should be aware of disturbances from other stations when using most available instruments. One mention of the AIM 4170 was made by K6MHE and the use of a GR bridge was mentioned by several including Walt.

If might be interesting to several to learn what K1PO ended up using.

While I have a GR bridge and the CIA hand held meter, I have found the AIM 4170 to be ideal. It ends up being used for several tasks and has not been disturbed by RF from others when connected to an antenna. Its ability to characterize a crystal is great - especially to someone who has done it the old way. This evening, I confirmed that one can use it to characterize a piece of coax for velocity, Zo, and (matched) loss. . . . and it is very easy to store the Z vs. frequency for latter comparison. . .

Another data point.   73, Mac N8TT

Be a chemist for a while. (Faraday was).

For a chemist everywhere is the saturated vapour, because everywhere are
solid bodies. Interstellar mediom = rare plasma and dust = saturated vapour
+ dust.
Such medium is ionised = contain ions and electrons.

Search for the answer if in such medium can propagate an electric waves.

You should find, quite surprisingly, that waves (vibrations) cause dust
coagulation (gravitation). Faraday predicted it.

Your insite is just astonishing.  You notice all the details from all of
the masters and combine them into something that NO ONE CAN DENY!!!!!

You are the awesome collector of all knowledge (supplied by Google) that
makes it all clear.

tom

I find that Ampere, Faraday, Stokes and Tesla are to difficult for teaching
programs. But their ideas are right.

For students the best is the magnetic whirl and solid aether.

Do you think that Tesla was using the knowledge from the textbooks?

I would be interested to read opinions on the article "Gimme an X, Gimme an O" published on December 2010 QST.

Thanks for feedback.

Hi Antonio,

Why not give us your opinion first? (It might help us who don't have access to the article to know what the opion is for.)

I was hoping to find someome having thoroughly read the article and ready to discuss his doubts.

Discussing the issues, starting from scratch, would lead to too long a debate.

Hi Tony,

To answer my question, it is not all that very difficult to give us some "opinion-based" appraisal, the article was:
1. not particularly distinguished;
2. remarkably good;
3. remarkably bad.

However, if 2 or 3 is offered in response, then there is something to remark. If it is remarkable, then there is some technical aspect to discuss (which means we depart from opinion, unfortunately, for the discussion to become rational).

I see no one offering a technically specific comment nor a general opinion. By this benchmark, then, this article must not be particularly distinguished or it is buried in an undistinguished publication.

However, given Brett's link I would find nothing at that link to debate either. On the positive side, that writing seems to rise above undistinguished work, but if you are not going to commit yourself, or

provide deeper insight, then my observation is strained to give it
that much benefit.

>Discussing the issues, starting from scratch, would lead to too long a debate.

The dynamics of discussion here are self regulating.   It would seem
the "debate," after six posting has yet to begin (and we are thus in a
long discussion about the shape of the debate table).

Not to pee on your Wheaties, but isn't QEX available online to ARRL members? Great magazine. Way more meat than QST.

The _indices_ are; the articles seem always to be unavailable for
reasons that don't make sense.

It makes sense if you realize ARRL is a publishing house and not much else.
Why would they give their products away.

 From the ARRL Web site itself:

http://www.arrl.org/arrl-periodicals-archive-search

"About this database. This database contains an index of articles for
QST from 1915 to the present, QEX from 1981 to the present, Ham Radio
from 1968 to 1990 and NCJ from 1973 to the present. (Note: Beginning in
1998, each issue of QEX covers two months. This index shows the first
month. For example, the index shows the January/February 1998 issue of
QEX as Jan 1998 QEX.)"

So, the index covers anything for which I'd be interested. But I am more
interested in obtaining past articles. Then there is this:

"QST Archive for Members Only - ARRL Members can access the QST magazine
archive online, from December 1915 through December 2007."

Also:

"ARRL Periodicals on CD-ROM - Recent volumes of QST magazine and back
issues of QEX, NCJ and Ham Radio magazines are available on CD-ROM."

I guess this means that, if you want to get articles later than 2007,
then you must buy the CD.

Thanks for spurring my research on this. Now I will re-evaluate the
importance of remaining a member.

John

I kinda thought that was what I was doing by being a member.

I've been paying:

ARRL membership	$39
QEX for members	$24

Total	$63

If I drop my ARRL membership the cost would be:

ARRL membership	$00
QEX non-member	$36

Total	$36

Almost a 43% reduction in cost to get the cream of publications. Of
course, I'd be giving up QST. Somehow, that doesn't bother me too much.

John

I re-joined ARRL a few years back after having let my membership lapse because of what I considered a lack of technical articles in QST. I was primarily a member to get QST. After my membership expired again, I got boatloads of mailings from ARRL, begging me to come back and even offering a choice of a book to get me to come back. I mailed back their letters with a hand written note saying I wasn't interested. They asked me why. I said QST isn't nearly technical enough for me anymore. They suggested I get QEX. So I made a "counter-offer"...I asked them to substitute QEX for QST. They basically laughed and said they couldn't do that. Seems it would have saved them some money as QEX only comes out 6 timers per year versus 12 for QST. So, now they get NO money from me...

I would respectfully suggest that you are missing the big picture. It's not just the magazine(s).

Like them or not, the ARRL is the ONLY organization that supports ham radio on a national level, going to bat for us before Congress and the FCC.

73,
Joe

Here in Au the number of members of the representative body (WIA) is
about 1/3 or less , having really bad representation which is expensive
is worse than having none at all

I like the little ads in back. It's interesting how they market some of
those radios. It reminds me of Sansui stereos.

QST is about the ads. QEX appeals to people who are pretty immune to ads.

Well, maybe. I think that the big picture depends on the desires of the
observer.

> Like them or not, the ARRL is the ONLY organization that supports ham

It is not that I do not like the ARRL. I've been a member for many years.

But, just being a member doesn't pay for that support. Notice from the
cost of membership shown on the ARRL site that only $8 per year is left
over after paying for QST. I'd bet that that $8 barely pays them to
maintain their records and Web site. What they apparently depend on for
money to represent us in Washington is donations. Along with volunteers,
perhaps.

So, does this mean that those of us who do not send in donations are
missing the big picture?

73,
John

Well, I overlooked the revenue generated by ads in QST. It is probably
true that a greater membership means a greater magazine circulation
which means ads can garner more because they reach a greater audience.

I just wanted that on record to show I am not advocating discontinuing
membership.

73,
John

Yes, I understand that very well.  However, they should have more money
to spend to fight for ham radio if they would let me substitute the 6
issues per year of QEX versus the 12 issues of QST.

Thanks guys !! I knew it was confusing, so the upshot of it all is the same polarization both ends, with some caveats - great

no, the changes don't always make aurora, and they are definately NOT
small. watch the speed on this for a few months, even without aurora
and see how much it changes. if the waves were traveling on the
charged particles then they would change speed just as much:
http://www.swpc.noaa.gov/ace/MAG_SWEPAM_24h.html

Also at its third (3/4WL) low impedance resonance where there are two
current maximum points on the helix.

Assuming ladder-line feeding 60 foot legs, switch between a 1/2WL
feeder on 80m and a 3/4WL feeder on 40m and get a near-perfect match
on both bands.

This thread has shown me that I don't know enough about Common Mode Chokes. I think they might also be referred to as transmission line chokes.

What I need to know is
1- When to use them. RF in the Shack is pretty obvious
2- When not to use them. There must be some negatives.
3- "Compare and Contrast" the Inductor-capacitor choke with the Ferrite Choke(W2DU). Are they electrically equivalent?
4- Are either of them a multi band solution?
5- Are there Upper and lower frequency limitations for using them.

As usual, a Google search provides an overwhelming set of responses that most likely will cover the subject in greater detail than I can digest.

Early in the list provided by the search I discovered
http://www.audiosystemsgroup.com/RFI-Ham.pdf

That may have all the answers but I have only glanced at the beginning of the 66 page document.

150 000 000km / 4days = 150 000 000 / 350 000s = 430 km/s.

For you it is the speed of the solar wind.
For me it is the speed of acoustic waves.

According to Faraday and today scientist the plasma is like metal.

Ions are the medium for acoustic waves and electrons for the electric (in metals and in plasma).

Have you a link with the method for measure the speed of solar wind?

S*

go to that link i gave you above, the 'normal' speed of the solar wind
like now is over 500km/s, it gets much faster when there is a coronal
hole or from a cme.

Richard
Ed Fong's article can be found on the ARRL website at
<http://www.arrl.org/files/file/Technology/tis/info/pdf/
0302038.pdf>.
I was able to access the above link without any password or other
challenge. I just reread it and found that he does address the
changes in the two meter element brought on by the inclusion of the
seventy centimeter trap. For one thing it shortens the two meter
element somewhat. So let me propose a modification process for my
collinear dual half wave two meter j-pole and you can tell me if you
can think of ways to rearrange or modify the steps so as to move
towards by hoped for results. What I hope to achieve is to maintain
the gain of the stacked, out of phase, dual half wave antenna on two
meters AND trap the lower have wave to a single half wave on seventy
centimeters.

Here are the steps I was thinking of:
Fabricate a trap from 1/2" copper pipe coming out of a tee that has
been cut in half through a plane perpendicular to the foot of the

tee.
Remove the top half wave and the phasing loop from the existing collinear dual half wave antenna
Attach the stub to the lower half wave so that the open bottom end of the stub is one half wave on UHF from the top of the matching stub.
Measure the SWR on 446 MHz. of the newly trapped two meter radiator.
Adjust stub location for minimum SWR at 446 MHz.
Measure SWR at 146 MHz.
Shorten that radiator to lowest SWR on two meters or until the two SWR readings for VHF & UHF are equal.
Reattach the upper two meter half wave and phasing stub.
Measure antenna for SWR on both VHF & UHF again
Adjust length of of upper two meter half wave if necessary.

The antenna analyzer that I will use will be an AEA Technology SWR Meter: 140-525. It happens to be what I have available to me.

Does my process seem to be along the right line or would you suggest a different order of operations?

<jferrell13@triad.rr.com> wrote:

> What I need to know is
>1- When to use them. RF in the Shack is pretty obvious

Hi John,

Sometimes it is not always that obvious, but it can be made obvious. I say this because the symptoms do not always draw our attention to the problem arising from Common Mode (CM) current.

One possible obvious symptom is that you can feel the current on the shielded components of your system - like a microphone shell when your lip brushes along it (which can sometimes give a nasty shock); or when you pull a connector and get that tingle of feeling (which might kill you if conditions were worse). "Obvious" can vary from subtle to deadly.

Another possible obvious symptom is you are moving a transmission line while keyed down, and you notice your SWR shifts at the same time. Is it because of a faulty connection? Sometimes yes, but we are talking about CM; and when it is CM, then that shift in SWR is because a tuned circuit (the line is now part of a dynamic system) has been changed.

* * * * * * * * *

Let's set aside in-the-shack symptoms and look at the antenna end of what might be obvious.

For beam antennas, through careful testing with known remote stations (beacons, for instance) you find that you have high sidelobes, almost no back rejection, and a broad response off the front. The transmission line coming down is acting like a vertical antenna, and is feeding its drive into the antenna feed point (two antennas in parallel). That extra antenna is picking up stations that would normally be suppressed by beam design.

Some folks never notice this - and it shows how benign CM can be (it is there full blown, but it is NOT obvious at all).

For wire antennas, you cut and cut and trim and trim your antenna to frequency, but even though it is book perfect (using the usual formulas for length), it is wildly out of whack and a bitch to tune with your tuner. Your dipole without choking is actually a tripole: two horizontal elements with a third vertical element (which is variable in length and relationship to ground/environment as it swings in the wind). You raise it higher to see if that does anything, and the tune shifts to the moon because the third element has gotten longer.

Again, some people never notice this, we have seen them; others do notice it and fulminate against the dipole as being a useless invention where their endfire (which suffers the same issues, but is magical by comparison) antenna is the cat's meow.

More could be said....

>2- When not to use them. There must be some negatives.

That is a natural question, but I cannot think of any down-side at all.

>3- "Compare and Contrast" the Inductor-capacitor choke with the
>Ferrite Choke(W2DU). Are they electrically equivalent?

They are NOT electrically equivalent. The ARE functionally equivalent - that is, they both suit the same purpose of introducing a very hi Z into the current path of CM.

The coil of transmission line is, on first pass approximation, an inductor whose Z climbs with applied frequency. The presumption is that it can only get better for the higher bands. This works to a point, but the same coil of TL also has loop-to-loop capacitance, and end-to-end capacitance. These two capacitances, at some frequency, become resonant and offer you a tank circuit. This works even better to isolate the current at the drive point from the rest of the line. However, a tank is not a wide band device by definition. It can exhibit an extremely hi Z at one frequency, and often high enough Z in neighboring bands (hence it is useful if you understand this). As you go higher in frequency, and for the very large coils suggested earlier, then the capacitances begin to dominate and actually kill any sense of choking.

The ferrite choke is a resistor, plain and simple. This means it is wide-banded - although its frequency characteristic is not universally applicable (this widebandedness usefully covers two, maybe three octaves). The formulation of the ferrite determines the coverage, and so you can either throw more beads into the mix, or use beads of different formulations to create a more flattened frequency response (over decades of frequency change).

>4- Are either of them a multi band solution?

Yes, as described above.

>5- Are there Upper and lower frequency limitations for using them.

That too is described above.

>As usual, a Google search provides an overwhelming set of responses
>that most likely will cover the subject in greater detail than I can
>digest.

>
>Early in the list provided by the search I discovered
>http://www.audiosystemsgroup.com/RFI-Ham.pdf
>
>That may have all the answers but I have only glanced at the beginning
>of the 66 page document.

It is a very good and broad discussion. The downside is its enormity.
However, this is not a simple topic and understanding comes slow.

The reason for that is that Common Mode analysis as distinct from
Differential Mode analysis immediately brings up the specter of WTF?
There are TWO currents flowing at the same time in the same circuit?

This perspective is usually very foreign and takes deep meditation to
come to grips with. It is difficult for the majority of the Pros too.

I am going to prompt readers for the next question:
     "What is common mode current?"
If any one cares to indulge me by asking, we can go further, but the
material in this posting is enough to digest in one sitting.

Hi Tom,

Right off the bat (yes I can see the article now) you offer a conflict. Out of phase blurs gain (lowers it). Your statement suggests you are losing from the start.

However, it could simply be wording. Let's make this simple:
1. State the gain at the frequencies of interest before the change;
2. State the gain at those frequencies you expect after the change.

>Here are the steps I was thinking of:
>Fabricate a trap from 1/2" copper pipe coming out of a tee that has
>been cut in half through a plane perpendicular to the foot of the

Lost already - sorry.

>Remove the top half wave and the phasing loop from the existing
>collinear dual half wave antenna
>Attach the stub to the lower half wave so that the open bottom end of
>the stub is one half wave on UHF from the top of the matching stub.
1>Measure the SWR on 446 MHz. of the newly trapped two meter radiator.
2>Adjust stub location for minimum SWR at 446 MHz.
3>Measure SWR at 146 MHz.
4>Shorten that radiator to lowest SWR on two meters or until the two
SWR
>readings for VHF & UHF are equal.

Probably not. You are going to be repeating steps 1-4 to even approach this desired end condition.

5>Reattach the upper two meter half wave and phasing stub.
6>Measure antenna for SWR on both VHF & UHF again
7>Adjust length of of upper two meter half wave if necessary.

This will disturb the work done in steps 1-4. You cannot rely on that configuration being isolated from the work in steps 5-7 which will also demand repeated attention. However, proceed with 5-7 repeats until you obtain the desired end condition.

NOW, revisit steps 1-4 with everything attached. I may be wrong, but I suspect you will need to trim things here again. And guess what? This means you need to visit and repeat steps 5-7 again.

And guess what? You will be visiting steps 1-4 AND 5-7 again, and again.

Take heart, these revisits "should" result in ever smaller adjustments. That means you will approach your desired end condition asymptotically.

>The antenna analyzer that I will use will be an AEA Technology SWR
>Meter: 140-525. It happens to be what I have available to me.
>
>Does my process seem to be along the right line or would you suggest a
>different order of operations?

The order is quite rational and fully expected. You are entirely on the right track. Your experience will reveal how much they are interactive and how sensitive all this is. If you anticipate the amount of repeated operations and plan accordingly, it will go far more quickly.

Epilogue

I would note that your writer does not offer any testing of sufficient caliber to support the claims of the EZNEC model. He merely provides signal reports using a sophisticated instrument (a spectrum analyzer that is not being used for spectrum analysis). Those reports also tell me that there is at best 1.2dB gain over a 1/4 wave design - very underwhelming. The only SWR data is reported as "The SWR was low."

The NEC software that I used for the results shown earlier doesn't allow enough segments to double the length of that helix. So I reconstructed the model in one that does -- link to screen clip from it below:

Hello Richard Fry,

Thanks for taking the time to do the simulation.

It seems from your graph that the electrically half wave (180 degr) helical has slightly more gain than the physically and electrically quarter wave (90 degr) radiator (5.61 dBi for the helical versus 5.14 dBi for the quarter wave whip).

Given the about 4 kOhms for 1/(Re(Y)), the loss in the 10 Ohms ground resistance is negligible (so at can be significantly higher before presenting significant loss). 900Vp at the feed point (100W input) will not give problems with matching.

With kind regards,

Wim

What fun would that be? We should cast away our aspergian proclivities
and embrace the occasional foray into acerbic wit.

Which is to say that Yes Richard knows something, and sometimes he'll
make an amusing comparison. If you ask, I'm certain he'll explain a
subject he's commented on if you ask.

And there is something in the donuts versus apples comparison.

The only one we're not allowed to use is apples and oranges.

A full-length half-wave monopole has gain over a full-length 1/4WL monopole because the current maximum point on the half-wave is elevated by 1/4WL. The same concept has to be a technical fact for the helical even though muted by the smaller physical distance between the current maximum points.

<go to that link i gave you above, the 'normal' speed of the solar wind like now is over 500km/s, it gets much faster when there is a coronal hole or from a cme.

"Mysterious waves that help transport the sun's energy out into space have been detected by scientists for the first time."
From: http://www.space.com/4279-mysterious-solar-ripples-detected.html

All real waves transport mass and energy. All medium vibrate. Electrons waves are in all media and ions/molecules must be also. The ions waves are not mystery. Their existence is obvious.
Is it?

That document certainly has a LOT of the answers... and good practical
data to use, as well.

One antenna is physically larger, though, right: 5.535m vs 3m?

How is radiation efficiency calculated here? Integral over hemisphere of
radiated power vs applied power   Seems like that would be
12.17/(10+12.17) vs 36/(10+36), so you're really just seeing a
manifestation of the different feedpoint impedance vs ground losses
(which you've assumed fixed..)

I'm not sure the assumption of fixed ground losses is reasonable here.
(Actually, now that I think about it, it might actually be worse for the
shorter element, in real life)

The other thing is that the shorter radiator is going to have a "lower
directivity" pattern vs the longer. That is, a shorter one will tend
towards the "Hertzian infinitestimal dipole" with 1.6dBi while the
longer will be closer to the 2.15dBi.

those waves have nothing to do with electromagnetic waves.

>

> Is it?
> S*

waves of ions is obvious, but not in the way you think. ions can flow
in one direction only unlike oscillating electromagnetic or sound
waves... more like water flowing downhill.

<waves of ions is obvious, but not in the way you think. ions can flow in one direction only

"hey, you got something right! yes, all mass can be made to vibrate one way or another"

In the oscillatory flow the net flow is in one direction only but ions travel to and fro.

<unlike oscillating electromagnetic or sound waves... more like water flowing downhill.

What do the ink particles in your ink printer?

I thought this was a likely scenario but you are the first I have
encountered that passed that along. Somewhere I read about a fellow
who was using spool of coax in the shack for a choke on 160M...
Well intentioned, but clearly not really a solution!

It is you who are indulging me!

Google and other Internet resources are very helpful but they are a
poor substitute for direct answers to direct questions.

As the sailor told the Captain, "I won't abandon the ship until the
keel comes through the foredeck!"

It seems to me that I might get an indication of current on the
outside using a Grid dip meter as a detector at various points on the
transmission coax.

I used to use a 48 element Collinear antenna on 439.25 MHz for Amateur TV in Ohio. It was designed by WA8RMC and constructed by WB8LGA.

The procedure to verify that each element was contributing something to the array was to power it with a small signal then watch a field strength meter as far away as you could see it and touch each element to see if it would produce a wiggle on the meter.

No wiggle means that particular element was not doing anything. I think you could do something similar to verify things are coupling.

That particular antenna was a collection of 24 dipole/reflectors in harness. I have been thinking about building another. It was only 4 feet by 6 feet but a whole lot of wind resistance.

I intentionally did not clip this post to keep things in context...

Hi John,

Another method (that I have not tried, and may be apocryphal) is to take large piece of tinfoil in your hand (the tin foil is gripped around the line) and move it along the line while watching the SWR meter.

The tin foil is used as a means to increase YOUR surface area to the line because you are the major conductor that is moving. You have diverted the Common Mode path away from where it was going, by moving into your hand, through your body, to your feet, and ground.

One very sure method is to insert an additional length of transmission line in series (will require a barrel connector). Some lengths are more dramatic in the shift of SWR than others (again, this is about wavelength).

This method has been reported to us here more than several times - unfortunately the reporters hadn't connected the dots to recognize this was a confirmation of CM.

>It seems to me that I might get an indication of current on the
>outside using a Grid dip meter as a detector at various points on the
>transmission coax.

Get a split core ferrite. Snap it around the coax. Add a short length of wire through the core. Connect the ends of the wire to an LED (now a complete circuit). Move the core/LED along the line during key-down. Did the LED glow?

Make sure to test the LED first to see if it glows (I can't imagine why it would not). Test the LED after this survey to see if it glows (I can imagine that CM current could have fried it). Play with adding more turns of the wire through the split core.

You have a simple portable RF transformer/indicator.

Let's say I build a horizontal dipole, trimmed for minimum SWR @
7.200 mhz.   I'll probably use 14-16 gauge insulated house wiring for
this antenna. It'd be a "nominal' quarter wavelength per leg.

This dipole will be fed with 50 ohm coax, and it will be erected
horizontally, 30 feet high over "average" ground.

What SWR reading could I expect to see from this antenna if I tried
to use it at 21.300 mhz........in the same environment as stated
above?

Thanks, folks......

I was wondering if anyone has experience interference from Solar Power Inverters.
I'm currently access various inverters and noticed that the Kaco Powador-4202 uses a high frequency isolation transformer, so I'm particularly interested in experience with this model, but also keen to hear general experience with these domestic solar power systems.

http://kaco-newenergy.de/en/site/312...te/details.xml

When TV was in in its infancy and in Ham TV we frequently used 300 ohm

twin lead transmission lines. The effect was dramatic when you wrapped foil around the twin lead and moved it up an down the feedline. If a half wave of line was accessible, You had the full range of tuning.

I also have a meter stick with a pair of wires on which I can slide a shorting bar. The usual indicator is a 50 micro amp meter with a 1n34 germanium diode and either a dipole or sense loop attached. Nearly all of that work was done at 440 mhz.

I will think about that LED indicator. Usually I keep the power low when doing this sort of thing. The threshold required to trigger the led. Also, once it triggers the abrupt transistion would probably affect the operating conditions. Perhaps it is time to increase the power a bit for such experiments...

I, and one of my friends, did have problems with a solar "charge controller", which I use with a small solar panel to trickle-charge / float an AGM battery.

It's apparently based on a buck-mode switching voltage regulator, down-regulating the voltage from a panel (nominal 18 volts open-circuit) to the lower voltage and higher current needed to charge a lead-acid battery properly. When my friend first installed one, his comment was "Holy QRM, Batman!". The switching noise was sufficient to wipe out reception on his HF radio transceiver nearby.

My guess at the time was that most of the RF was being radiated out of the solar panel and the 15-20' of wire running to it. I suggested buying a standard AC power-line filter module (the sort made by Corcom and many others) or two, placing one on the solar-panel side of the charge controller and the other on the battery-being-charged side. These modules can choke/filter out both common-mode and differential noise.

This completely eliminate the QRM problem. Apparently the amount of RF noise radiated directly by the controller itself is negligible... the switching noise is only a problem if it's fed into wires long enough to act as antennas.

EMI filters of this sort aren't hard to come by on the surplus market, and are also available new. You might want to consider spec'ing a filter of this sort as part of any solar-charger or solar-inverter system you have installed. RFI/EMI levels which are low enough to meet legal requirements, may still be high enough to interfere with some sensitive communications... extra filtering may save you from this.

Hey Cecil -

I got:

Impedance = 85.26 - J 186.3 ohms
SWR (50 ohm system) = 10.337 (75 ohm system) = 7.308

Let's see if we can determine why they don't match.

I adjusted the wire length for no reactance at 7.2 MHz.
I used 99 segments of #14 wire. I did not include insulation effects.

How about yours?

John

Oops! I just noticed that I had zero wire resistance. Changed it to copper but only got a slight change:

```
Impedance = 87.47 - J 184 ohms
SWR (50 ohm system) =  9.960  (75 ohm system) =  7.042
```

```

I don't think so ...

Ocean waves, sound waves, through water/air, pretty much, and just vibrate matter in place. They don't really use movement of matter though matter as locamotion, i.e. no "real" matter gets transported, they simply affect more matter, by "bumping it", which in turn affects more matter, etc. Or, simply matter vibrating ... energy vibrating it.

Ions are like bullets, they do use movement as their means of transporting themselves, and they don't "remain in place."

Ether fills space, the space between the atoms of air, and all other matter (and, most likely, even fills the space within an atom!) ... it simply can be made to "vibrate", like water vibrating in place and creating waves which transverse the pond ...

The ether/wave model is the only model which can, and in quite simple terms and design, account for waves transversing non-empty space (a vacuum containing only ether.)

All other models which have been constructed require elaborate explanations and examples which are only imaginary in existence (no direct physical examples can be had/seen.)

Someone should be able to make quite a comfortable monetary living keeping Occams' Razor honed sharp!

Regards,
JS

If you tune it down a bit so you resonate at perhaps 7.15, then the
third harmonic will be closer to 21.3. It's a dipole, so not real high
Q, particularly on the fundamental, so maybe what you do is go for a
compromise tuning.. A bit low on 40 and a bit high on 15.

Well, yeah, I know. But, I'm trying to simulate based on the OP's info
and Cecil's results.

John

Are you using 9 segments?

John

I think may have missed something on how segmentation works.  I thought
you needed an even number of segments to split a dipole evenly.

So while 99 is close to centered by my logic, if 9 was used it might
skew things a bit.

If I'm off base please tell me so I can adjust my model of how NEC works.

Thanks.

tom

Hi, Tom -

As far as I am aware, using an odd number of segments in a wire allows
the source to be placed in the center of a segment with equal numbers of
segments on each side.

Think of it this way: a source needs to be in the middle of a segment.
So, you need an even number of segments on each side to keep everything
balanced. If so, then the total number of segments needs to be odd.

If this does not make sense, please ask again and I'll try with more detail.

Cheers,
John

Just put it up and see what happens.

Slap a tuner in the line.

Or check out a fan dipole.

Or buy a pair of 15 meter traps and use the design sheet that comes
with them to build a 40-15 trap dipole.

I've used parallel fed "fan" dipoles for years.
But I've never bothered with legs for 15m..
Always used the 40 m legs for 15m.. Guess a habit back
from my novice days.. Back then, my old transmitters
would match either load no sweat.. No tuner required..
Heck, I didn't even use an SWR meter when I first
started..   :/ Never missed it either..
With my modern rigs, the match on 15m, using the
40m legs is usually a tad higher than I'd like for
S/S finals.. :(
So I slap a tuner into the picture as a "line
flattener". Even a cheapy MFJ random wire tuner will

match that.. And most internal radio tuners could
probably handle it ok.
It's not too far off from being a 3/4 wave on 15m.
None of my radios have internal tuners, but
I have several stand alone tuners.

Hello Jim,

Given a certain medium, both phase and group velocity can be frequency dependent (example: ionosphere).

DRM uses OFDM to achieve very low baudrate to mitigate the dispersive behavior of ionospheric propopation. A least 88 subcarriers are in 10 kHz bandwidth.

No, I already bought these antennas last year when I was very sick, so
I didn't check everything as I should have. I just wanted a close
number of degrees for the radiation angle. Cushcraft says they can't
hazard a guess. That's really poor. Just something close was all I was
after.

>value to you.

Good advice, but doesn't apply in this case. I'm back into building
yet another repeater:
<http://802.11junk.com/jeffl/K6BJ-MSF5000/>
Due to a combination of club politics and my laziness, the repeater

will be tested at my house for a hopefully limited time. Unfortunately, I couldn't find a suitable antenna and decided that the trashed Diamond X50 was the least disgusting alternative to doing it the right way. As long as it doesn't destroy the power amp with excess VSWR, it should be fine for testing.

Various sympathetic friends have also offered to sell me spare antennas. I could also build one (I'm partial to a center fed Franklin/Amos antenna, but have only built these for 2.4Ghz, not 440Mhz).
<http://802.11junk.com/jeffl/antennas/AMOS-7/index.html>
But first, I need to finish some work, and complete my taxes.

>Moores law tells me that it is probably past it's prime and it probably
>isn't going to last very long anyways.

<http://en.wikipedia.org/wiki/Moore%27s_law>
Moore's law has to do with the number of xsistors on integrated circuits, not the lifetime of my antennas and other abominations.

>A friend of mine has a antenna that sounds identical to the one you are
>trying to repair and the lengths on his antenna looks to be 12 inches.

I've seen several from the ground, but have been too lazy to climb the towers or drop the poles in order to make the measurement.

>I have not taken it down to physically measure it, but we are about to
>move it in a month or two and if you still need the exact measurement -
>I will get it for you.

Thanks for the offer. I don't think it will be necessary but it would be nice to know the real lengths. I fabricated some radials using brass welding rods and found that the lengths are non-critical. Scaling the length from a photo, I guessed high at about 10" and cut them to 11". When I find the real dimensions, I'll cut them to size.

>I am surprised that the manufacturer didn't offer give you the
>dimensions.
>Diamond X50 - radial / part number 07003
>http://www.rfparts.com/diamond/x50a.html

Y'er right. I should have called RFparts.

Thanks much.

List of Solutions Manuals and Test Banks
----------------------------------------

contact me to :         mattosbw1@gmail.com
mattosbw1(at)gmail.com
```

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

Solution Manual Fundamentals of Thermal-Fluid Sciences (3rd Ed., Yunus Cengel & Robert Turner)
Solution Manual Thermodynamics : An Engineering Approach (5th Ed., Yunus Cengel)
Solution Manual Thermodynamics : An Engineering Approach (6th Ed., Yunus Cengel & Michael Boles)
Solution Manual Thermodynamics : An Engineering Approach (7th Ed., Yunus Cengel & Michael Boles)
Solution Manual Essentials of Fluid Mechanics : Fundamentals and Applications (1st Ed., Yunus Cengel, John Cimbala)
Solution Manual Fluid Mechanics (1st Ed., Yunus Cengel & John Cimbala)
Solution Manual Fluid Mechanics (2nd Ed., Yunus Cengel & John Cimbala)
Solution Manual Heat Tranfer (2nd Ed., Yunus Cengel)
Solution Manual Heat and Mass Transfer : A Practical Approach (3rd Ed., Yunus Cengel)
Solution Manual Heat and Mass Transfer : Fundamentals and Applications (4th Ed., Yunus Cengel & Afshin Ghajar)
Solution Manual Introduction to Fluid Mechanics (6th Ed., Robert Fox, Alan McDonald & Philip Pritchard)
Solution Manual Introduction to Fluid Mechanics (7th Ed., Robert Fox, Philip Pritchard & Alan McDonald)
Solution Manual Fox and McDonald's Introduction to Fluid Mechanics (8th Ed., Philip Pritchard)
Solution Manual Fluid Mechanics (5th Ed., Douglas)
Solution Manual Fluid Mechanics (3rd Ed., Kundu & Cohen)
Solution Manual Fluid Mechanics (4th Ed., Kundu & Cohen)
Solution Manual Elementary Fluid Mechanics (7th Ed., Street, Watters & Vennard)
Solution Manual Fluid Mechanics with Engineering Applications (10th Ed., Finnemore & Franzini)
Solution Manual Fundamentals of Fluid Mechanics (4th Ed., Bruce Munson, Donald Young, Theodore Okiishi)
Solution Manual Fundamentals of Fluid Mechanics (5th Ed., Bruce Munson, Donald Young, Theodore Okiishi)
Solution Manual Fundamentals of Fluid Mechanics (6th Ed., Bruce Munson, Donald Young, Theodore Okiishi, Wade Huebsch)
Solution Manual Fundamentals of Fluid Mechanics - SI Units (6th Ed., Bruce Munson, Donald Young, Theodore Okiishi, Wade Huebsch)
Solution Manual A Brief Introduction to Fluid Mechanics (3rd Ed., Donald Young, Bruce Munson, Theodore Okiishi)
Solution Manual A Brief Introduction to Fluid Mechanics (4th Ed., Donald Young, Bruce Munson, Theodore Okiishi, Wade Huebsch)
Solution Manual A Brief Introduction to Fluid Mechanics (5th Ed., Donald Young, Bruce Munson, Theodore Okiishi, Wade Huebsch)

Solution Manual Engineering Fluid Mechanics (7th Ed., Clayton Crowe, Donald Elger, John Roberson)
Solution Manual Engineering Fluid Mechanics (8th Ed., Clayton Crowe, Donald Elger, John Roberson)
Solution Manual Engineering Fluid Mechanics (9th Ed., Clayton Crowe, Donald Elger, John Roberson, Barbara Williams)
Solution Manual Fluid Mechanics (Potter & Foss)
Solution Manual Mechanics of Fluids (3rd Ed., Potter)
Solution Manual Fluid Power with Applications (7th Ed., Esposito)
Solution Manual Mechanics of Fluids (4th Ed., Shames)
Solution Manual Applied Fluid Mechanics (6th Ed., Mott)
Solution Manual Applied Fluid Mechanics - SI Units (6th Ed., Mott)
Solution Manual Hydraulic Control Systems (Noah Manring)
Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (5th Ed., S.L. Dixon)
Solution Manual Fluid Mechanics and Thermodynamics of Turbomachinery (6th Ed., S.L. Dixon & Cesare Hall)
Solution Manual The Design of High-Efficiency Turbomachinery and Gas Turbines (2nd Ed., David Gordon Wilson & Theododios Korakianitis)
Solution Manual Fundamentals of Turbomachinery (William Peng)
Solution Manual Principles of Turbomachinery in Air-Breathing Engines (Baskharone)
Solution Manual Fundamentals of Jet Propulsion with Applications (Ronald D. Flack)
Solution Manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution Manual Thermodynamics : An Integrated Learning System (Schmidt, Ezekoye, Howell & Baker)
Solution Manual Design of Fluid Thermal Systems (2nd Ed., William Janna)
Solution Manual Design and Simulation of Thermal Systems (N.V. Suryanarayana & Oner Arici)
Solution Manual Introduction to Thermal and Fluids Engineering (Kaminski & Jensen)
Solution Manual Heating, Ventilating and Air Conditioning Analysis and Design (6th Ed., McQuiston)
Solution Manual Electricity, Electronics, and Control Systems for HVAC (4th Ed., Thomas Kissell)
Solution Manual Heat and Mass Transfer (Anthony Mills)
Solution Manual Heat Transfer (2nd Ed., A.F. Mills)
Solution Manual Basic Heat and Mass Transfer (2nd Ed., A.F. Mills)
Solution Manual Convective Heat and Mass Transfer (4th Ed., Kays & Crawford)
Solution Manual Advanced Engineering Thermodynamics (3rd Ed., Bejan)
Solution Manual Convection Heat Transfer (3rd Ed., Bejan)
Solution Manual Design with Constructal Theory (Adrian Bejan & Sylvie Lorente)
Solution Manual Shape and Structure, from Engineering to Nature (Adrian Bejan)
Solution Manual Thermodynamics : Concepts and Applications (Stephen Turns)
Solution Manual Heat Transfer (10th Ed., Jack Holman)
Solution Manual Principles of Heat Transfer (Kaviany)

Solution Manual Heat Convection (Latif M. Jiji)
Solution Manual Fundamentals of Momentum, Heat and Mass Transfer (5th Ed., Welty)
Solution Manual Analytical Methods for Heat Transfer and Fluid Flow Problems (Bernhard Weigand)
Solution Manual Two-Phase Flow : Theory and Applications (Clement Kleinstreuer)
Solution Manual Convective Heat Transfer (kakac)
Solution Manual An Introduction to Fluid Dynamics : Principles of Analysis and Design (Stanley Middleman)
Solution Manual An Introduction to Mass and Heat Transfer : Principles of Analysis and Design (Stanley Middleman)
Solution Manual Fundamentals of Thermodynamics (5th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (6th Ed., Richard Sonntag, Claus Borgnakke & Gordon Van Wylen)
Solution Manual Fundamentals of Thermodynamics (7th Ed., Claus Borgnakke & Richard Sonntag)
Solution Manual Introduction to Engineering Thermodynamics (1st Ed., Richard Sonntag & Claus Borgnakke)
Solution Manual Introduction to Engineering Thermodynamics (2nd Ed., Richard Sonntag & Claus Borgnakke)
Solution Manual Fundamentals of Engineering Thermodynamics (5th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics - SI Units (6th Ed., Michael Moran, Howard Shapiro)
Solution Manual Fundamentals of Engineering Thermodynamics (7th Ed., Michael Moran, Howard Shapiro, Daisie Boettner, Margaret Bailey)
Solution Manual Fundamentals of Heat and Mass Transfer (5th Ed., Incropera, DeWitt)
Solution Manual Fundamentals of Heat and Mass Transfer (6th Ed., Incropera, DeWitt)
Solution Manual Introduction to Heat Transfer (4th Ed., Incropera, DeWitt)
Solution Manual Introduction to Heat Transfer (5th Ed., Incropera, DeWitt)
Solution Manual Radiation Detection and Measurement (3rd Ed., Glenn Knoll)
Solution Manual Radiation Detection and Measurement (4th Ed., Glenn Knoll)
Solution Manual Radiative Heat Transfer (2nd Ed., Michael Modest)
Solution Manual Computational Heat Transfer (2nd Ed., Jaluria)
Solution Manual Principles of Combustion (2nd Ed., Kenneth Kuan-yun Kuo)
Solution Manual An Introduction to Combustion : Concepts and Applications (3rd Ed., Stephen R. Turns)
Solution Manual Combustion (2nd Ed., Irvin Glassman)
Solution Manual Combustion (3rd Ed., Irvin Glassman)
Solution Manual Incompressible Flow (3rd Ed., Panton)
Solution Manual Modern Compressible Flow : With Historical Perspective (3rd Ed., John Anderson)

Solution Manual Non-Newtonian Flow : Fundamentals and Engineering Applications (R.P. Chhabra & J F Richardson)
Solution Manual Computational Techniques for Fluid Dynamics (Srinivas, K., Fletcher, C.A.J.)
Solution Manual Introduction to Computational Fluid Dynamics (A.W. Date)
Solution Manual Robot Modeling and Control (Spong, Hutchinson & Vidyasagar)
Solution Manual Introduction to Robotics: Analysis, Control, Applications (Saeed B. Niku)
Solution Manual Theory of Applied Robotics : Kinematics, Dynamics and Control (Reza N. Jazar)
Solution Manual Control of Robot Manipulators in Joint Space (R. Kelly, V. Santib=E1=F1ez, A. Lor=EDa)
Solution Manual Modelling and Control of Robot Manipulators (2nd Ed., Lorenzo Sciavicco, Bruno Siciliano)
Solution Manual Robotics : Modelling, Planning and Control (Bruno Siciliano, Lorenzo Sciavicco, Luigi Villani & Giuseppe Oriolo)
Solution Manual Fundamentals of Robotic Mechanical Systems : Theory, Methods, and Algorithms (3rd Ed., Jorge Angeles)
Solution Manual Kinematic Chains and Machine Components Design (Dan B. Marghitu)
Solution Manual Kinematics, Dynamics, and Design of Machinery (2nd Ed., Waldron & Kinzel)
Solution Manual Kinematics and Dynamics of Machinery (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Kinematics and Dynamics of Machinery - SI Units (3rd Ed., Charles E. Wilson & J. Peter Sadler)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (3rd Ed., David H. Myszka)
Solution Manual Machines and Mechanisms : Applied Kinematic Analysis (4th Ed., David H. Myszka)
Solution Manual Mechanism Design : Analysis and Synthesis (4th Ed., Erdman, Sandor & Kota)
Solution Manual Mechanical Design : A Components Approach (2nd Ed., Peter Childs)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (1st Ed., Collins)
Solution Manual Mechanical Design of Machine Elements and Machines : A Failure Prevention Perspective (2nd Ed., Collins, Busby & Staab)
Solution Manual Fundamentals of Machine Component Design (3rd Ed., Juvinall)
Solution Manual Fundamentals of Machine Component Design (4th Ed., Juvinall)
Solution Manual Design of Machine Elements (8th Ed., Spotts)
Solution Manual Machine Elements in Mechanical Design (4th Ed., Mott)
Solution Manual Machine Elements in Mechanical Design - SI Units (4th Ed., Mott)
Solution Manual Mechanical Design : An Integrated Approach (1st Ed., Ansel Ugural)
Solution Manual Design of Machinery (3rd Ed., Norton)
Solution Manual Design of Machinery (4th Ed., Norton)
Solution Manual Machine Design : An Integrated Approach (3rd Ed.,

Norton)
Solution Manual Machine Design : An Integrated Approach (4th Ed., Norton)
Solution Manual Mechanical Engineering Design (6th Ed., Shigley)
Solution Manual Mechanical Engineering Design (7th Ed., Shigley, Mischke & Budynas)
Solution Manual Shigley's Mechanical Engineering Design (8th Ed., Budynas & Nisbett)
Solution Manual Shigley's Mechanical Engineering Design (9th Ed., Budynas & Nisbett)
Solution Manual Fundamentals of Machine Elements (1st Ed., Hamrock)
Solution Manual Fundamentals of Machine Elements (2nd Ed., Hamrock)
Solution Manual Mechanics of Materials : A Modern Integration of Mechanics and Materials in Structural Design (Christopher Jenkins & Sanjeev Khanna)
Solution Manual Mechanics of Materials (3th Ed., Beer)
Solution Manual Mechanics of Materials (5th Ed., Gere & Timoshenko)
Solution Manual Mechanics of Materials (6th Ed., Gere & Timoshenko)
Solution Manual Mechanics of Materials (7th Ed., Gere & Goodno)
Solution Manual Mechanics of Materials (Ansel Ugural)
Solution Manual Mechanics of Materials : An Integrated Learning System (1st Ed., Timothy Philpot)
Solution Manual Mechanics of Materials : An Integrated Learning System (2nd Ed., Timothy Philpot)
Solution Manual Mechanics of Materials (2nd Ed., Roy R. Craig)
Solution Manual Simplified Mechanics and Strength of Materials (6th Ed., James Ambrose)
Solution Manual Engineering Applications of Dynamics (Dean Karnopp & Donald Margolis)
Solution Manual Engineering Mechanics : Statics (Arthur Boresi, Richard Schmidt)
Solution Manual Engineering Mechanics : Dynamics (Arthur Boresi, Richard Schmidt)
Solution Manual Engineering Mechanics : Statics (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics - SI Version (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Statics - SI Version (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics - SI Version (5th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Engineering Mechanics : Dynamics - SI Version (6th Ed., J. L. Meriam, L. G. Kraige)
Solution Manual Vector Mechanics for Engineers : Statics (7th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Statics (8th Ed., Ferdinand Beer)

Solution Manual Vector Mechanics for Engineers : Dynamics (7th Ed., Ferdinand Beer)
Solution Manual Vector Mechanics for Engineers : Dynamics (8th Ed., Ferdinand Beer)
Solution Manual Statics : Analysis and Design of Systems in Equilibrium (Sheppard & Tongue)
Solution Manual Statics : Analysis and Design of Systems in Equilibrium - Update Edition (Sheppard & Tongue)
Solution Manual Dynamics : Analysis and Design of Systems in Motion (Sheppard & Tongue)
Solution Manual Dynamics : Analysis and Design of Systems in Motion (2nd Ed., Sheppard & Tongue)
Solution Manual Statics and Mechanics of Materials : An Integrated Approach (2nd Ed., Riley, Sturges & Morris)
Solution Manual Mechanics of Materials (6th Ed., Riley, Sturges & Morris)
Solution Manual Basic Engineering Plasticity : An Introduction with Engineering and Manufacturing Applications (David Rees)
Solution Manual Theory of Plasticity (3rd Ed. Jagabanduhu Chakrabarty)
Solution Manual Deformation and Fracture Mechanics of Engineering Materials (4th Ed., Richard Hertzberg)
Solution Manual Deformable Bodies and Their Material Behavior (Haslach & Armstrong)
Solution Manual Intermediate Mechanics of Materials (1st Ed., Barber)
Solution Manual Elasticity (2nd Ed., J.R. Barber)
Solution Manual Elasticity : Theory, Applications, and Numerics (1st Ed., Martin Sadd)
Solution Manual Elasticity : Theory, Applications, and Numerics (2nd Ed., Martin Sadd)
Solution Manual Elasticity in Engineering Mechanics (2nd Ed., Boresi)
Solution Manual Advanced Mechanics of Materials (6th Ed., Boresi)
Solution Manual Advanced Mechanics of Materials (2nd Ed., Cook & Young)
Solution Manual Metal Fatigue in Engineering (2nd Ed., Stephens, Fatemi & Fuchs)
Solution Manual Applied Mechanics for Engineering Technology (8th Ed., Keith M. Walker)
Solution Manual Applied Statics and Strength of Materials (5th Ed. Limbrunner & Spiegel)
Solution Manual Statics and Strength of Materials (Robert Mott)
Solution Manual Applied Strength of Materials (4th Ed., Mott)
Solution Manual Applied Strength of Materials (5th Ed., Mott)
Solution Manual Intermediate Dynamics for Engineers (Marcelo R.M & Crespo da Silva)
Solution Manual Engineering Mechanics : Statics (Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Dynamics (Michael Plesha, Gary Gray & Francesco Costanzo)
Solution Manual Engineering Mechanics : Statics (4th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Statics (5th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Statics - SI Units (5th Ed.,

Anthony Bedford, Wallace Fowler & Yusof Ahmad)
Solution Manual Engineering Mechanics : Dynamics (4th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Dynamics (5th Ed., Anthony Bedford & Wallace Fowler)
Solution Manual Engineering Mechanics : Dynamics - SI Units (5th Ed., Anthony Bedford, Wallace Fowler & Yusof Ahmad)
Solution Manual Elastic And Inelastic Stress Analysis (Irving Shames)
Solution Manual Thermal Stresses (2nd Ed., Noda, Hetnarski & Tanigawa)
Solution Manual Strength of Materials - A New Unified Theory for the 21st Century (Surya Patnaik & Dale Hopkins)
Solution Manual Statics and Strengths of Materials (6th Ed., Morrow & Kokernak)
Solution Manual Statics and Strengths of Materials (7th Ed., Morrow & Kokernak)
Solution Manual Engineering Mechanics : Statics (11th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Statics (12th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Statics - SI Units (12th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Dynamics (11th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Dynamics (12th Ed., Hibbeler)
Solution Manual Engineering Mechanics : Dynamics - SI Units (12th Ed., Hibbeler)
Solution Manual Mechanics of Materials (4th Ed., Hibbeler)
Solution Manual Mechanics of Materials (6th Ed., Hibbeler)
Solution Manual Mechanics of Materials (7th Ed., Hibbeler)
Solution Manual Mechanics of Materials - SI Units (7th Ed., Hibbeler)
Solution Manual Mechanics of Materials (8th Ed., Hibbeler)
Solution Manual Statics and Mechanics of Materials (Beer, Johnston, DeWolf & Mazurek)
Solution Manual Statics and Mechanics of Materials (Bedford, Liechti & Fowler)
Solution Manual Statics and Mechanics of Materials (2nd Ed., Hibbeler)
Solution Manual Statics and Mechanics of Materials - SI Units (2nd Ed., Hibbeler)
Solution Manual Statics and Mechanics of Materials (3rd Ed., Hibbeler)
Solution Manual Energy Principles and Variational Methods in Applied Mechanics (2nd Ed., Reddy)
Solution Manual The Physics of Vibrations and Waves (6th Ed., Pain)
Solution Manual Engineering Vibrations (3rd Ed., Inman)
Solution Manual Mechanical Vibrations - SI Units (4th Ed., Singiresu S. Rao)
Solution Manual Mechanical Vibrations (5th Ed., Singiresu S. Rao)
Solution Manual Theory of Vibration : An Introduction (2nd Ed., A.A. Shabana)
Solution Manual Vibration of Discrete and Continuous Systems (2nd Ed., Ahmed Shabana)
Solution Manual Introduction to Finite Element Vibration Analysis (Maurice Petyt)
Solution Manual Vibrations and Stability : Advanced Theory, Analysis, and Tools (2nd Ed., Jon J. Thomsen)
Solution Manual Dynamics and Vibration : An Introduction (Magd Abdel Wahab)

Solution Manual Mechanical Vibration (William J. Palm, III)
Solution Manual Random Vibrations : Analysis of Structural and Mechanical Systems (Loren Lutes & Shahram Sarkani)
Solution Manual Mechanical and Structural Vibrations : Theory and Applications (by Jerry H. Ginsberg)
Solution Manual Fundamentals of Structural Integrity : Damage Tolerant Design and Nondestructive Evaluation (Alten F. Grandt)
Solution Manual A First Course in the Finite Element Method (4th Ed., Daryl L. Logan)
Solution Manual Finite Element Analysis Theory and Application with ANSYS (3rd Ed., Moaveni)
Solution Manual An Introduction to the Finite Element Method (3rd Ed., J. N. Reddy)
Solution Manual Fundamentals of Finite Element Analysis (1st Ed., David V. Hutton)
Solution Manual The Finite Element Method in Engineering (4th Ed., Rao)
Solution Manual The Finite Element Method in Engineering (5th Ed., Rao)
Solution Manual The Finite Element Method and Applications in Engineering Using ANSYS (Madenci & Guven)
Solution Manual Introduction to Finite Element Analysis and Design (Nam-Ho Kim, Bhavani V. Sankar)
Solution Manual Introduction to the Finite Element Method : Theory, Programming and Applications (Erik G. Thompson)
Solution Manual The Finite Element Method : Its Basis and Fundamentals (6th Ed., Zienkiewicz, R. L. Taylor & J.Z. Zhu)
Solution Manual Fundamental Finite Element Analysis and Applications : with Mathematica and Matlab Computations (Asghar Bhatti)
Solution Manual Advanced Topics in Finite Element Analysis of Structures : With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution Manual Modeling and Analysis of Dynamic Systems (3rd Ed., Close)
Solution Manual Modeling and Simulation of Dynamic Systems (Robert Woods, Jr. & Kent Lawrence)
Solution Manual System Dynamics (1st Ed., William J Palm III)
Solution Manual System Dynamics (2nd Ed., William J Palm III)
Solution Manual System Dynamics and Response (S. Graham Kelly)
Solution Manual System Dynamics for Engineering Students : Concepts and Applications (Nicolae Lobontiu)
Solution Manual Dynamic Modeling and Control of Engineering Systems (2nd Ed., J. Lowen Shearer, Bohdan Kulakowski, John Gardner)
Solution Manual System Dynamics : Modeling and Simulation of Mechatronic Systems (4th Ed., Karnopp, Margolis & Rosenberg)
Solution Manual Concepts and Applications of Finite Element Analysis (4th Ed., Cook, Malkus, Plesha & Witt)
Solution Manual Finite Element Modeling for Stress Analysis (Robert Cook)
Solution Manual Fracture Mechanics : Fundamentals and Applications (2nd Ed., T.L. Anderson)
Solution Manual Mechanical Behavior of Materials (3rd Ed., Dowling)
Solution Manual Mechanical Behavior of Materials (W.F. Hosford)
Solution Manual Mechanical Behavior of Materials (Keith Bowman)

Solution Manual Theory and Design for Mechanical Measurements (4th Ed., Figliola & Beasley)
Solution Manual Theory and Design for Mechanical Measurements (5th Ed., Figliola & Beasley)
Solution Manual Mechanical Measurements (6th Ed., Beckwith, Marangoni & Lienhard)
Solution Manual Measurement and Data Analysis for Engineering and Science (Patrick Dunn)
Solution Manual Design and Analysis of Lean Production Systems (Askin & Goldberg)
Solution Manual Computer-Aided Manufacturing (3rd Ed., Tien-Chien Chang, Richard A. Wysk, Hsu-Pin Wang)
Solution Manual Work Systems : The Methods, Measurement & Management of Work (Mikell P. Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (2nd Ed., Groover)
Solution Manual Automation, Production Systems, and Computer-Integrated Manufacturing (3rd Ed., Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (3rd Ed., Mikell Groover)
Solution Manual Fundamentals of Modern Manufacturing : Materials, Processes, and Systems (4th Ed., Mikell Groover)
Solution Manual Materials and Processes in Manufacturing (9th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual DeGarmo's Materials and Processes in Manufacturing (10th Ed., E. Paul DeGarmo, J. T. Black, Ronald A. Kohser)
Solution Manual Principles of Metal Manufacturing Processes (Beddoes & Bibby)
Solution Manual Design for Manufacturing : A Structured Approach (Corrado Poli)
Solution Manual Fundamentals of Manufacturing (2nd Ed., Philip D. Rufe)
Solution Manual Engineering Materials Science (Milton Ohring)
Solution Manual Engineering Materials : Properties and Selection (8th Ed., Budinski)
Solution Manual Engineering Materials : Properties and Selection (9th Ed., Budinski)
Solution Manual Materials Science for Engineering Students (Traugott Fischer)
Solution Manual Essentials of Modern Materials Science and Engineering (James Newell)
Solution Manual Science and Design of Engineering Materials (2nd Ed., Schaffer, Saxena, et al)
Solution Manual Structure and Properties of Engineering Materiales (5th Ed., Daniel Henkel & Alan Pense)
Solution Manual Materials Selection in Mechanical Design (3rd Ed., Michael Ashby)
Solution Manual Materials Selection in Mechanical Design (4th Ed., Michael Ashby)
Solution Manual Materials : Engineering, Science, Processing and Design (1st Ed., Michael Ashby, Hugh Shercliff & David Cebon)
Solution Manual Materials : Engineering, Science, Processing and Design (2nd Ed., Michael Ashby, Hugh Shercliff & David Cebon)

Solution Manual Engineering Materials Vol. 1 : An Introduction to Properties, Applications and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Engineering Materials Vol. 2 : An Introduction to Microstructures, Processing and Design (3rd Ed., Michael Ashby & David Jones)
Solution Manual Materials Science and Engineering : An Introduction (6th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (7th Ed., William Callister)
Solution Manual Materials Science and Engineering : An Introduction (8th Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (2nd Ed., William Callister)
Solution Manual Fundamentals of Materials Science and Engineering : Integrated Approach (3rd Ed., William Callister)
Solution Manual Foundations of Materials Science and Engineering (3rd Ed, Smith)
Solution Manual Foundations of Materials Science and Engineering (4th Ed, Smith & Hashemi)
Solution Manual Foundations of Materials Science and Engineering (5th Ed, Smith & Hashemi)
Solution Manual Introduction to Materials Science for Engineers (6th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers (7th Ed., Shackelford)
Solution Manual Introduction to Materials Science for Engineers - International Edition (7th Ed., Shackelford)
Solution Manual Manufacturing Facilities Design and Material Handling (3rd Ed., Meyers & Stephens)
Solution Manual Manufacturing Facilities Design and Material Handling (4th Ed., Stephens & Meyers)
Solution Manual Manufacturing Processes for Engineering Materials (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing Processes for Engineering Materials - SI Units (5th Ed. Kalpakjian, Smith & Chih-Wah Kok)
Solution Manual Manufacturing, Engineering & Technology (5th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology (6th Ed. Kalpakjian & Smith)
Solution Manual Manufacturing, Engineering & Technology - SI Units (6th Ed. Kalpakjian & Smith)
Solution Manual Principles of Corrosion Engineering and Corrosion Control (Zaki Ahmad)
Solution Manual Steels : Microstructure and Properties (3rd Ed. Bhadeshia & Honeycombe)
Solution Manual Analysis and Performance of Fiber Composites (3rd Ed., Bhagwan Agarwal, Lawrence Broutman & K. Chandrashekhara)
Solution Manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution Manual Applied Manufacturing Process Planning : With Emphasis on Metal Forming and Machining (Nelson, Schneider)
Solution Manual Mastering CAD/CAM (1st Ed., Ibrahim Zeid)

Solution Manual Principles of CAD/CAM/CAE (Kunwoo Lee)
Solution Manual Computer Numerical Control : Operation and Programming (3rd Ed., Stenerson & Curran)
Solution Manual Introduction to Computer Numerical Control (4th Ed., Valentino & Goldenberg)
Solution Manual Linear State-Space Control Systems (Robert L. Williams, II & Douglas A. Lawrence)
Solution Manual Gas Turbine Theory (6th Ed., H.I.H. Saravanamuttoo, G.F.C. Rogers, H. Cohen & Paul Straznicky)
Solution Manual Rocket Propulsion Elements (7th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Rocket Propulsion Elements (8th Ed., George P. Sutton & Oscar Biblarz)
Solution Manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution Manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution Manual Atmospheric and Space Flight Dynamics : Modeling and Simulation with MATLAB and Simulink (Ashish Tewari)
Solution Manual Flight Dynamics Principles (2nd Ed., by Cook)
Solution Manual Mechanics of Flight (1st Ed., Warren F. Phillips)
Solution Manual Mechanics of Flight (2nd Ed., Warren F. Phillips)
Solution Manual Modern Flight Dynamics (David K. Schmidt)
Solution Manual Fundamentals of Airplane Flight Mechanics (David G. Hull)
Solution Manual Dynamics of Flight : Stability and Control (3rd Ed., Bernard Etkin & Lloyd Duff Reid)
Solution Manual Aircraft Rescue and Firefighting (5th Ed., IFSTA)
Solution Manual Aircraft Propulsion (Saeed Farokhi)
Solution Manual Aircraft Performance (Maido Saarlas)
Solution Manual Design of Aircraft (Thomas C. Corke)
Solution Manual Flight Performance of Fixed and Rotary Wing Aircraft (Antonio Filippone)
Solution Manual Fundamentals Of Aircraft Structural Analysis (Howard Curtis)
Solution Manual Aircraft Control and Simulation (2nd Ed., Brian Stevens & Frank Lewis)
Solution Manual Aircraft Structures for Engineering Students (3rd Ed., T.H.G. Megson)
Solution Manual Aircraft Structures for Engineering Students (4th Ed., T.H.G. Megson)
Solution Manual Introduction to Aircraft Structural Analysis (T.H.G. Megson)
Solution Manual Mechanics of Aircraft Structures (2nd Ed, C. T. Sun)
Solution Manual Principles of Helicopter Aerodynamics (1st Ed., Leishman)
Solution Manual Fundamentals of Aerodynamics (2nd Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (3th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (4th Ed., Anderson)
Solution Manual Fundamentals of Aerodynamics (5th Ed., Anderson)
Solution Manual Aerodynamics for Engineers (5th Ed., John Bertin & Russell Cummings)
Solution Manual Introduction to Flight (5th Ed., Anderson)

Solution Manual Introduction to Flight (6th Ed., Anderson)
Solution Manual Mechatronics : Principles and Applications (Godfrey Onwubolu)
Solution Manual Mechatronics (Sabri Cetinkunt)
Solution Manual Introduction to Mechatronic Design (J. Edward Carryer, Matthew Ohline & Thomas Kenny)
Solution Manual Introduction to Mechatronics and Measurement Systems (2nd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (3rd Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Mechatronics and Measurement Systems (4th Ed., David Alciatore & Michael Histand)
Solution Manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution Manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution Manual Gas Dynamics (3rd Ed., John & Keith)
Solution Manual Fundamentals of Gas Dynamics (2nd Ed, Robert D. Zucker)
Solution Manual Theory of Ground Vehicles (3rd Ed., J. Y. Wong)
Solution Manual Theory of Ground Vehicles (4th Ed., J. Y. Wong)
Solution Manual Vehicle Dynamics : Theory and Application (Reza Jazar)
Solution Manual Internal Combustion Engines : Applied Thermosciences (2nd Ed., Ferguson & Kirkpatrick)
Solution Manual Advanced Engine Performance Diagnosis (4th Ed., James Halderman)
Solution Manual Automotive Engines (8th Ed., Crouse)
Solution Manual Automotive Heating & Air Conditioning (5th Ed., Tom Birch)
Solution Manual Diagnosis and Troubleshooting of Automotive Electrical, Electronic, and Computer Systems (5th Ed., James Halderman)
Solution Manual Automotive Brake Systems Package (4th Ed., Rehkopf)
Solution Manual Automotive Brake Systems (4th Ed., Halderman)
Solution Manual Automotive Engine Performance (2nd Ed., Halderman)
Solution Manual Automotive Engines : Theory and Servicing (6th Ed., James Halderman)
Solution Manual Automotive Fuel and Emissions Control Systems (2nd Ed., James Halderman & James Linder)
Solution Manual Automotive Science and Mathematics (Allan Bonnick)
Solution Manual Automotive Mathematics (Jason Rouvel)
Solution Manual Automotive Service Management (Andrew Rezin)
Solution Manual Automotive Technology : Principles, Diagnosis, and Service (3rd Ed., Halderman)
Solution Manual Automotive Steering, Suspension, and Alignment (4th Ed., Halderman)
Solution Manual Automatic Transmissions & Transaxles (4th Ed., Tom Birch & Chuck Rockwood)
Solution Manual Hybrid and Alternative Fuel Vehicles (Halderman & Martin)
Solution Manual Manual Drivetrains and Axles (5th Ed., Birch & Rockwood)
Solution Manual Blueprint Reading for the Machine Trades (6th Ed.,

Schultz & Smith)
Solution Manual Modern Welding Technology (6th Ed., Cary & Helzer)
Solution Manual Tissue Engineering (Bernhard O. Palsson & Sangeeta N. Bhatia)
Solution Manual Tissue Engineering (Clemens van Blitterswijk, et al.)
Solution Manual Tissue Mechanics (Cowin, Doty)
Solution Manual Technology and Society (3rd Ed., Hjorth, Eichler, Khan & Morello)
Solution Manual BTEC First Engineering Curriculum Support Pack (Mike Tooley)
Solution Manual BTEC First Engineering (Mike Tooley)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (1st Ed., Philip Kosky, George Wise, Robert Balmer & William Keat)
Solution Manual Exploring Engineering : An Introduction to Engineering and Design (2nd Ed., Philip Kosky, Robert Balmer, William Keat & George Wise)
Solution Manual Engineering Science (5th Ed., W. Bolton)
Solution Manual Principles of Energy Conversion (2nd Ed., Archie W. Culp)
Solution Manual Fundamentals of Renewable Energy Processes (1st Ed., Aldo da Rosa)
Solution Manual Fundamentals of Renewable Energy Processes (2nd Ed., Aldo da Rosa)
Solution Manual Alternative Energy Systems (B. K. Hodge)
Solution Manual Solar Energy Engineering : Processes and Systems (Soteris Kalogirou)
Solution Manual Solar Engineering of Thermal Processes (2nd Ed., John Duffie & William Beckman)
Solution Manual Solar Engineering of Thermal Processes (3rd Ed., John Duffie & William Beckman)
Solution Manual Energy Technology and Directions for the Future (Fanchi)
Solution Manual Power Generation Technologies (Paul Breeze)
Solution Manual Concepts in Engineering (Holtzapple & Reece)
Solution Manual Concepts in Engineering (2nd Ed., Holtzapple & Reece)
Solution Manual Foundations of Engineering (2nd Ed, Holtzapple & Dan Reece)
Solution Manual Industrial Mechanics and Maintenance (3rd Ed., Larry Chastain)
Solution Manual Mechanical and Electrical Equipment for Buildings (10th Ed., Stein, Reynolds, Grondzik, Kwok)
Solution Manual Mechanical and Electrical Equipment for Buildings (11th Ed., Grondzik, Kwok, Stein & Reynolds)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Engineering Drawing And Design (7th Ed., Jensen, Helsel & Short)
Solution Manual Autodesk Inventor (James M. Leake)
Solution Manual Engineering Design Graphics : Sketching, Modeling, and Visualization (1st Ed., James Leake & Jacob Borgerson)
Solution Manual Orthopaedic Biomechanics : Mechanics and Design in Musculoskeletal Systems (Donald Bartel, Dwight Davy & Tony Keaveny)

Solution Manual Science for Engineering (3rd Ed., John Bird)

List of Solutions Manuals and Test Banks
----------------------------------------

contact me to :         mattosbw1@gmail.com
mattosbw1(at)gmail.com
```

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR :   CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

- Electrical, Electronics & Computer Engineering :

Solution Manual Design for Electrical and Computer Engineers (J. Eric

Salt & Robert Rothery)
Solution Manual Electrical Engineering : Principles and Applications (3rd Ed., Hambley)
Solution Manual Electrical Engineering : Principles and Applications (4th Ed., Hambley)
Solution Manual Electrical Engineering : Principles and Applications (5th Ed., Hambley)
Solution Manual Electronics (2nd Ed., Hambley)
Solution Manual Electronics and Communications for Scientists and Engineers (Martin Plonus)
Solution Manual Cryptography & Network Security (Behrouz A Forouzan)
Solution Manual Data Communications and Networking (3rd Ed., Behrouz A. Forouzan)
Solution Manual Data Communications and Networking (4th Ed., Behrouz A. Forouzan)
Solution Manual TCP/IP Protocol Suite (2nd Ed., Behrouz Forouzan)
Solution Manual TCP/IP Protocol Suite (3rd Ed., Behrouz Forouzan)
Solution Manual TCP/IP Protocol Suite (4th Ed., Behrouz Forouzan)
Solution Manual Local Area Networks (Behrouz A Forouzan)
Solution Manual Analog Integrated Circuits for Communication : Principles, Simulation and Design (2nd Ed., Donald Pederson & Kartikeya Mayaram)
Solution Manual Satellite Communications (2nd Ed, Pratt, Bostian, Allnutt)
Solution Manual Business Data Communications (Behrouz A Forouzan)
Solution Manual Logic and Computer Design Fundamentals (4th Ed., Mano & Kime)
Solution Manual Linear Robust Control (Michael Green, David J. N. Limebeer)
Solution Manual Adaptive Control (2nd Ed., Karl Johan Astrom, Bjorn Wittenmark)
Solution Manual Digital Control Engineering : Analysis and Design (M. Sami Fadali & Antonio Visioli)
Solution Manual Computer-Controlled Systems : Theory and Design (3rd Ed., Karl Johan Astrom & Bjorn Wittenmark)
Solution Manual Electric Circuits (7th Ed., Nilsson & Riedel)
Solution Manual Electric Circuits (8th Ed., Nilsson & Riedel)
Solution Manual Electric Circuits (9th Ed., Nilsson & Riedel)
Solution Manual Introductory Circuits for Electrical and Computer Engineering (James Nilsson, Susan Riedel)
Solution Manual Electromagnetic Noise and Quantum Optical Measurements (Hermann A. Haus)
Solution Manual Optical Fiber Communications (4th Ed., Gerd Keiser)
Solution Manual Electromagnetics (Branislav M. Notaros)
Solution Manual Electromagnetics for Engineers (Fawwaz T. Ulaby)
Solution Manual Fundamentals of Applied Electromagnetics (5th Ed., Fawwaz T. Ulaby)
Solution Manual Fundamentals of Applied Electromagnetics (6th Ed., Ulaby, Michielssen & Ravaioli)
Solution Manual Applied Electromagnetics : Early Transmission Lines Approach (Stuart Wentworth)
Solution Manual Fundamentals of Electromagnetics with Engineering Applications (Stuart Wentworth)

Solution Manual Electromagnetics for Engineers : With Applications to Digital Systems and Electromagnetic Interference (Clayton Paul)
Solution Manual MEMS & Microsystems : Design and Manufacture (1st Ed., Tai-Ran Hsu)
Solution Manual MEMS & Microsystems : Design, Manufacture, and Nanoscale Engineering (2nd Ed., Tai-Ran Hsu)
Solution Manual Probability and Statistics for Engineering and the Sciences (7th Ed., Jay L. DeVore)
Solution Manual Probability and Stochastic Processes : A Friendly Introduction for Electrical and Computer Engineers (2nd Ed., Roy Yates & David Goodman)
Solution Manual Process Systems Analysis and Control (3rd Ed. Donald Coughanowr, Steven LeBlanc)
Solution Manual Fuel Cell Engines (Matthew M. Mench)
Solution Manual Fuel Cell Fundamentals (1st Ed., Ryan O'Hayre, et. al)
Solution Manual Fuel Cell Fundamentals (2nd Ed., Ryan O'Hayre, Whitney Colella, Suk-Won Cha, Fritz Prinz)
Solution Manual Control Systems Engineering (4th Ed., Norman Nise)
Solution Manual Control Systems Engineering (5th Ed., Norman Nise)
Solution Manual Control Systems Engineering (6th Ed., Norman Nise)
Solution Manual Automatic Control Systems (8th Ed., Benjamin C. Kuo, Farid Golnaraghi)
Solution Manual Automatic Control Systems (9th Ed., Farid Golnaraghi, Benjamin C. Kuo)
Solution Manual Basic Electricity for Industry : Circuits and Machines - Canadian Edition (Doug Edgar)
Solution Manual Basic Engineering Circuit Analysis (8th Ed., Irwin & Nelms)
Solution Manual Basic Engineering Circuit Analysis (9th Ed., Irwin & Nelms)
Solution Manual Basic Engineering Circuit Analysis (10th Ed., Irwin & Nelms)
Solution Manual A Brief Introduction to Circuit Analysis (J. David Irwin)
Solution Manual Semiconductor Devices : Basic Principles (Jasprit Singh)
Solution Manual Semiconductor Device Fundamentals (Robert F. Pierret)
Solution Manual Advanced Semiconductor Fundamentals (2nd Ed., Robert F. Pierret)
Solution Manual Device Electronics for Integrated Circuits (3rd Ed., Richard S. Muller, Theodore I. Kamins)
Solution Manual Fundamentals of Semiconductor Devices (Anderson)
Solution Manual Scientific Computing (2nd Ed., Michael T. Heath)
Solution Manual Scientific Computing with Case Studies (Dianne P. O'Leary)
Solution Manual Pattern Recognition and Machine Learning (Christopher M. Bishop)
Solution Manual Modern Semiconductor Devices for Integrated Circuits (Chenming C. Hu)
Solution Manual Analysis and Design of Analog Integrated Circuits (4th Ed., Paul Gray, et al.)
Solution Manual Analysis and Design of Analog Integrated Circuits (5th Ed., Paul Gray)

Solution Manual Analysis and Design of Digital Integrated Circuits (3rd Ed., Hodges)
Solution Manual Introduction to Electric Circuits (6th Ed., Dorf & Svoboda)
Solution Manual Introduction to Electric Circuits (7th Ed., Dorf & Svoboda)
Solution Manual Introduction to Electric Circuits (8th Ed., Dorf & Svoboda)
Solution Manual Modulation, Detection and Coding (Tommy =D6berg)
Solution Manual Principles of Communications: Systems, Modulation, and Noise (5th Ed., R.E. Ziemer & W.H. Tranter)
Solution Manual Principles of Communications (6th Ed., R.E. Ziemer & W.H. Tranter)
Solution Manual The Analysis and Design of Linear Circuits (4th Ed, Thomas & Rosa)
Solution Manual The Analysis and Design of Linear Circuits : Laplace Early (4th Ed, Thomas & Rosa)
Solution Manual The Analysis and Design of Linear Circuits (5th Ed, Thomas)
Solution Manual The Analysis and Design of Linear Circuits (6th Ed, Thomas, Rosa & Toussaint)
Solution Manual Dynamic Modeling and Control of Engineering Systems (2nd Ed., J. Lowen Shearer, Bohdan Kulakowski, John Gardner)
Solution Manual Modern Control Systems (11th Ed., Dorf & Bishop)
Solution Manual Modern Control Systems (12th Ed., Dorf & Bishop)
Solution Manual System Dynamics (1st Ed., William Palm III)
Solution Manual System Dynamics (2nd Ed., William Palm III)
Solution Manual System Dynamics and Response (S. Graham Kelly)
Solution Manual System Dynamics for Engineering Students : Concepts and Applications (Nicolae Lobontiu)
Solution Manual Optimal Control (2nd Ed., Frank Lewis & Vassilis Syrmos)
Solution Manual Optimal Control Theory : An Introduction (Donald E. Kirk)
Solution Manual Power Electronics (1st Ed., Daniel W. Hart)
Solution Manual Power Electronic Circuits (Issa Batarseh)
Solution Manual Power Electronics : Circuits, Devices and Applications (3rd Ed., Muhammad H. Rashid)
Solution Manual Power Electronics : Converters, Applications, and Design (3rd Ed., Ned Mohan, Tore Undeland & William Robbins)
Solution Manual Intuitive Probability and Random Processes using MATLAB (Steven Kay)
Solution Manual Signals and Systems using MATLAB (Luis Chaparro)
Solution Manual Analog Signals and Systems (Erhan Kudeki & David C. Munson, Jr.)
Solution Manual Continuous and Discrete Time Signals and Systems (Mrinal Mandal, Amir Asif)
Solution Manual Digital Signal and Image Processing (Tamal Bose)
Solution Manual Digital Image Processing (2nd Ed., Rafael Gonzalez, Richard Woods)
Solution Manual A Wavelet Tour of Signal Processing : The Sparse Way (3rd Ed., Stephane Mallat)
Solution Manual Discrete-Time Signal Processing (2nd Ed., Alan

Oppenheim, Ronald Schafer, John Buck)
Solution Manual Discrete-Time Signal Processing (3rd Ed., Alan Oppenheim & Ronald Schafer)
Solution Manual Signal Processing First (James H. McClellan, Ronald W. Schafer, Mark A. Yoder)
Solution Manual Statistical Digital Signal Processing and Modeling (Monson Hayes)
Solution Manual Digital Signal Processing (Thomas J. Cavicchi)
Solution Manual Digital Signal Processing System Design : LabVIEW-Based Hybrid Programming (2nd Ed., Kehtarnavaz)
Solution Manual Digital Signal Processing (2nd Ed., Mitra)
Solution Manual Digital Signal Processing (3rd Ed., Mitra)
Solution Manual Digital Signal Processing (4th Ed., Mitra)
Solution Manual Digital Signal Processing (4th Ed., John G. Proakis, Dimitris K Manolakis)
Solution Manual Digital Signal Processing (Charles Schuler & Mahesh Chugani)
Solution Manual Digital Signal Processing : Fundamentals and Applications (Li Tan)
Solution Manual Digital Signal Processing : An Experimental Approach (Shlomo Engelberg)
Solution Manual Digital Signal Processing : System Analysis and Design (Paulo S. R. Diniz)
Solution Manual Digital Signal Processing : A Modern Introduction (Ashok Ambardar)
Solution Manual Engineering Optimization : Theory and Practice (4th Ed., Singiresu S. Rao)
Solution Manual Applied Optimization with MATLAB Programming (1st Ed., P. Venkataraman)
Solution Manual Applied Optimization with MATLAB Programming (2nd Ed., P. Venkataraman)
Solution Manual Introduction to Applied Optimization (2nd Ed., Urmila Diwekar)
Solution Manual Logic Synthesis and Verification Algorithms (Gary Hachtel & Fabio Somenzi)
Solution Manual Adaptive Filtering : Algorithms and Practical Implementation (3rd Ed., Paulo S. R. Diniz)
Solution Manual Introduction to Scientific Computation and Programming (Daniel T. kaplan)
Solution Manual Principles of Signal Detection and Parameter Estimation (Bernard C. Levy)
Solution Manual Electric Machines Analysis and Design Applying MatLab (Cathey)
Solution Manual Fundamentals of Electrical Engineering (Giorgio Rizzoni)
Solution Manual Principles and Applications of Electrical Engineering (4th Ed, Rizzoni)
Solution Manual Principles and Applications of Electrical Engineering (5th Ed, Rizzoni)
Solution Manual Fundamentals of Electric Circuits (2nd Ed., Alexander & Sadiku)
Solution Manual Fundamentals of Electric Circuits (3rd Ed., Alexander & Sadiku)

Solution Manual Fundamentals of Electric Circuits (4th Ed., Alexander & Sadiku)
Solution Manual MSP430 Microcontroller Basics (John Davies)
Solution Manual Programming Massively Parallel Processors : A Hands-on Approach (David Kirk & Wen-mei Hwu)
Solution Manual Embedded Systems and Software Validation (Abhik Roychoudhury)
Solution Manual Embedded Systems Design with Platform FPGAs : Principles and Practices (Ronald Sass, Andrew Schmidt)
Solution Manual Embedded DSP Processor Design : Application Specific Instruction Set Processors (Dake Liu)
Solution Manual Embedded Microcontrollers and Processor Design (Charles Greg Osborn)
Solution Manual Embedded System Design : A Unified Hardware/Software Introduction (Vahid & Givargis)
Solution Manual Embedded Microcomputer Systems : Real Time Interfacing (2nd Ed., Jonathan W. Valvano)
Solution Manual Introduction to Programming with C++ (2nd Ed., Y. Daniel Liang)
Solution Manual Matlab : A Practical Introduction to Programming and Problem Solving (Stormy Attaway)
Solution Manual Principles of Computer System Design : An Introduction (Jerome Saltzer & M. Frans Kaashoek)
Solution Manual The Illustrated Network : How TCP/IP Works in a Modern Network (Walter Goralski)
Solution Manual Electronic Design Automation : Synthesis, Verification, and Test (Laung-Terng Wang, Yao-Wen Chang & Kwang-Ting Cheng)
Solution Manual Digital Design (Frank Vahid)
Solution Manual Digital Design with RTL Design, Verilog and VHDL (2nd Ed., Frank Vahid)
Solution Manual Digital Logic Design Principles (Balabanian & Carlson)
Solution Manual Fundamentals of Logic Design (5th Ed., Charles H. Roth)
Solution Manual Real-Time Systems and Software (Alan Shaw)
Solution Manual Introduction to VLSI Circuits and Systems (John P. Uyemura)
Solution Manual Chip Design for Submicron VLSI : CMOS Layout & Simulation (John Uyemura)
Solution Manual Classical Electrodynamics (2nd Ed., John David Jackson)
Solution Manual Objects, Abstraction, Data Structures and Design : Using C++ (Elliot B. Koffman & Paul A. T. Wolfgang)
Solution Manual Objects, Abstraction, Data Structures and Design Using Java Version 5.0 (Elliot B. Koffman & Paul A. T. Wolfgang)
Solution Manual Computer Architecture and Organization : An Integrated Approach (Murdocca & Heuring)
Solution Manual Wiley Pathways Networking Basics (1st Ed., Ciccarelli, Faulkner, FitzGerald, Dennis & Miller)
Solution Manual Software Engineering : Principles and Practice (3rd Ed., Hans van Vliet)
Solution Manual Software Design : From Programming to Architecture (Eric Braude)

Solution Manual Software Engineering : An Object-Oriented Perspective (Eric Braude)
Solution Manual Software Engineering : Modern Approaches (2nd Ed., Eric Braude & Michael Bernstein)
Solution Manual Neural and Adaptive Systems : Fundamentals through Simulations (Jos=E9 Principe, Neil Euliano & W. Curt Lefebvre)
Solution Manual Fundamentals of Electronic Circuit Design (David J. Comer & Donald T. Comer)
Solution Manual Microelectronic Circuit Design (2nd Ed., Jaeger & Blalock)
Solution Manual Microelectronic Circuit Design (3rd Ed., Jaeger & Blalock)
Solution Manual Microelectronic Circuit Design (4th Ed., Jaeger & Blalock)
Solution Manual Introduction to Microelectronic Fabrication : Volume 5 of Modular Series on Solid State Devices (2nd Ed., Richard Jaeger)
Solution Manual Microelectronic Circuits (5th Ed., Adel S. Sedra, K. C. Smith)
Solution Manual VHDL for Engineers (Kenneth Short)
Solution Manual Fundamentals of Digital Logic with VHDL Design (1st Ed., Brown & Vranesic)
Solution Manual Fundamentals of Digital Logic with VHDL Design (2nd Ed., Brown & Vranesic)
Solution Manual Fundamentals of Digital Logic with VHDL Design (3rd Ed., Brown & Vranesic)
Solution Manual CMOS Analog Circuit Design (2nd Ed., Phillip E. Allen, Douglas R. Holberg)
Solution Manual Design of Analog CMOS Integrated Circuits (Behzad Razavi)
Solution Manual Design of Integrated Circuits for Optical Communications (Behzad Razavi)
Solution Manual Fundamentals of Microelectronics, Preliminary Edition (Behzad Razavi)
Solution Manual Fundamentals of Microelectronics (1st Ed., Behzad Razavi)
Solution Manual Design with Operational Amplifiers and Analog Integrated Circuits (3rd Ed., Sergio Franco)
Solution Manual Your UNIX : The Ultimate Guide (1st Ed., Sumitabha Das)
Solution Manual Your UNIX : The Ultimate Guide (2nd Ed., Sumitabha Das)
Solution Manual Microwave Engineering (Annapurna Das)
Solution Manual Microwave Engineering (3rd Ed., David M. Pozar)
Solution Manual Microwave and RF Design of Wireless Systems (David M. Pozar)
Solution Manual Introduction to Wireless Systems (P. M. Shankar)
Solution Manual Microwave Transistor Amplifiers : Analysis and Design (2nd Ed., Guillermo Gonzalez)
Solution Manual Control Systems (Madan Gopal)
Solution Manual A First Lab in Circuits and Electronics (Yannis Tsividis)
Solution Manual Power System Analysis : Analysis and Design (John Grainger)

Solution Manual Power Systems Analysis (2nd Ed., Hadi Saadat)
Solution Manual Power Systems Analysis and Design (4th Ed., J.Duncan Glover and Mulukutla S. Sarma)
Solution Manual An Introduction to Digital and Analog Communications (2nd Ed., Simon Haykin & Michael Moher)
Solution Manual Communication Systems (4th Ed., Simon Haykin)
Solution Manual Communication Systems (5th Ed., Simon Haykin)
Solution Manual Communication Systems (4th Ed., A. Bruce Carlson, Paul B. Crilly, Janet Rutledge)
Solution Manual Communication Systems (5th Ed., A. Bruce Carlson, Paul B. Crilly)
Solution Manual Signals and Systems (2nd Ed., Simon Haykin & Barry Van Veen)
Solution Manual Introduction to Computing Systems : From bits & gates to C & beyond (1st Ed., Patt and Patel)
Solution Manual Introduction to Computing Systems : From bits & gates to C & beyond (2nd Ed., Patt and Patel)
Solution Manual Elements of the Theory of Computation (2nd Ed., Lewis & Papadimitriou)
Solution Manual Introduction to Languages and the Theory of Computation (3rd Ed., John Martin)
Solution Manual Introduction to Languages and the Theory of Computation (4th Ed., John Martin)
Solution Manual Mechanical & Electrical Systems in Buildings (4th Ed., Richard Janis & William Tao)
Solution Manual Silicon VLSI Technology : Fundamentals, Practice, and Modeling (Plummer, Deal & Griffin)
Solution Manual Dynamic Electromagnetics (Paul Diament)
Solution Manual Engineering Electromagnetics (2nd Ed., Nathan Ida)
Solution Manual Engineering Electromagnetics (Kenneth Demarest)
Solution Manual Field and Wave Electromagnetics (1st Ed., David Cheng)
Solution Manual Fundamentals of Engineering Electromagnetics (David Cheng)
Solution Manual Information Modeling and Relational Databases (2nd Ed., Terry Halpin & Tony Morgan)
Solution Manual Probability, Statistics, and Random Processes For Electrical Engineering (3rd Ed., Alberto Leon-Garcia)
Solution Manual Detection and Estimation Theory (Thomas Schonhoff & Arthur Giordano)
Solution Manual The Intel Microprocessors (8th Ed., Barry B. Brey)
Solution Manual Wireless Networking (Kumar, Manjunath & Kuri)
Solution Manual Wireless Communications : Principles and Practice (2nd Ed., Theodore S. Rappaport)
Solution Manual Digital Electronics and Design with VHDL (Volnei A. Pedroni)
Solution Manual System-on-Chip Test Architectures : Nanometer Design for Testability (Wang, Stroud & Touba)
Solution Manual Digital Design (Verilog) : An Embedded Systems Approach Using Verilog (Peter Ashenden)
Solution Manual Digital Design (VHDL) : An Embedded Systems Approach Using VHDL (Peter Ashenden)
Solution Manual Computer Organization and Design : The Hardware/ Software Interface (3rd Ed., Patterson & Hennessy)

Solution Manual Computer Organization and Design : The Hardware/Software Interface (4th Ed., Patterson & Hennessy)
Solution Manual Fundamentals of Computer Organization and Design (Sivarama P. Dandamudi)
Solution Manual Wireless Communications & Networking (Vijay Garg)
Solution Manual Network Flows : Theory, Algorithms, and Applications (Ravindra K. Ahuja, Thomas L. Magnanti, James B. Orlin)
Solution Manual Network Analysis, Architecture, and Design (3rd Ed., James McCabe)
Solution Manual Computer Networks : A Systems Approach (4th Ed., Peterson & Davie)
Solution Manual Computer Networks ISE : A Systems Approach (4th Ed., Peterson & Davie)
Solution Manual Digital Design and Computer Architecture (David Harris & Sarah Harris)
Solution Manual Fault-Tolerant Systems (Israel Koren & C. Krishna)
Solution Manual Computer Architecture : Pipelined and Parallel Processor Design (Michael J. Flynn)
Solution Manual Computer Architecture : A Quantitative Approach (4th Ed., Hennessy & Patterson)
Solution Manual High-Performance Embedded Computing : Architectures, Applications, and Methodologies (Wayne Wolf)
Solution Manual Pattern Recognition (3rd Ed., Theodoridis & Koutroumbas)
Solution Manual Pattern Recognition (4th Ed., Theodoridis & Koutroumbas)
Solution Manual Data Mining : Concepts and Techniques (2nd Ed., Han & Kamber)
Solution Manual Commonsense Reasoning (Erik Mueller)
Solution Manual Introduction to Data Compression (3rd Ed., Khalid Sayood)
Solution Manual Programming Language Pragmatics (2nd Ed., Michael Scott)
Solution Manual Programming Language Pragmatics (3rd Ed., Michael Scott)
Solution Manual Computer Graphics for Java Programmers (2nd Ed., Leen Ammeraal & Kang Zhang)
Solution Manual Database Modeling and Design : Logical Design (4th Ed., Teorey, Lightstone & Nadeau)
Solution Manual Computers As Components : Principles of Embedded Computing System Design (1st Ed., Wayne Wolf)
Solution Manual Computers As Components : Principles of Embedded Computing System Design (2nd Ed., Wayne Wolf)
Solution Manual Virtual Machines : Versatile Platforms for Systems and Processes (Jim Smith & Ravi Nair)
Solution Manual Comprehensive Functional Verification : The Complete Industry Cycle (Wile, Goss & Roesner)
Solution Manual User Interface Design and Evaluation (Stone, Jarrett, Woodroffe & Minocha)
Solution Manual Network Algorithmics : An Interdisciplinary Approach to Designing Fast Networked Devices (George Varghese)
Solution Manual Data Modeling Essentials (3rd Ed., Simsion & Witt)
Solution Manual A Student Guide to Object-Oriented Development (Carol

Britton & Jill Doake)
Solution Manual Routing, Flow, and Capacity Design in Communication and Computer Networks (Pioro & Medhi)
Solution Manual Knowledge Representation and Reasoning (Brachman & Levesque)
Solution Manual Communication Networking : An Analytical Approach (Anurag Kumar, D. Manjunath & Joy Kuri)
Solution Manual Principles and Practices of Interconnection Networks (Dally & Towles)
Solution Manual Game Physics (David Eberly)
Solution Manual Engineering a Compiler (Keith Cooper & Linda Torczon)
Solution Manual Constraint Processing (Rina Dechter)
Solution Manual Design Methods for Reactive Systems : Yourdon, Statemate, and the UML (R. J. Wieringa)
Solution Manual Temporal Data & the Relational Model (C.J. Date, Darwen & Lorentzos)
Solution Manual Java Made Simple (2nd Ed., P. K. McBride)
Solution Manual The Firmware Handbook (Jack Ganssle)
Solution Manual Optical Networks : A Practical Perspective (2nd Ed., Ramaswami & Sivarajan)
Solution Manual Optical Networks : A Practical Perspective (3rd Ed., Ramaswami, Sivarajan & Sasaki)
Solution Manual Usability Engineering : Scenario-Based Development of Human-Computer Interaction (Rosson & Carroll)
Solution Manual The Designer's Guide to VHDL (2nd Ed., Peter Ashenden)
Solution Manual Transactional Information Systems : Theory, Algorithms, and the Practice of Concurrency Control and Recovery (Weikum & Vossen)
Solution Manual Parallel Computer Architecture : A Hardware/Software Approach (Culler, Singh & Gupta)
Solution Manual Advanced Compiler Design and Implementation (Steven Muchnick)
Solution Manual Parallel Programming with MPI (Peter Pacheco)
Solution Manual Distributed Algorithms (Nancy Lynch)
Solution Manual Electrical and Electronic : Principles and Technology (3rd Ed., John Bird)
Solution Manual Electrical and Electronic : Principles and Technology (4th Ed., John Bird)
Solution Manual Electrical Circuit Theory and Technology (3rd Ed., John Bird)
Solution Manual Electrical Circuit Theory and Technology (4th Ed., John Bird)
Solution Manual Electronic Circuits : Fundamentals & Applications (3rd Ed., Mike Tooley)
Solution Manual A Practical Guide to SysML : The Systems Modeling Language (Friedenthal, Moore & Steiner)
Solution Manual Multidimensional Signal, Image, and Video Processing and Coding (John Woods)
Solution Manual Bioelectrical Signal Processing in Cardiac and Neurological Applications (Leif S=F6rnmo & Pablo Laguna)
Solution Manual Foundations of Analog and Digital Electronic Circuits (Anant Agarwal & Jeffrey Lang)
Solution Manual Introduction to Linear Circuit Analysis and

Modelling : From DC to RF (Luis Moura & Izzat Darwazeh)
Solution Manual Embedded Systems Architecture : A Comprehensive Guide for Engineers and Programmers (Tammy Noergaard)
Solution Manual Bioimpedance and Bioelectricity Basics (2nd Ed., Grimnes & Martinsen)
Solution Manual Simulation with Arena (5th Ed., Kelton, Sadowski & Swets)
Solution Manual Simulation Modeling and Analysis with ARENA (Tayfur Altiok & Benjamin Melamed)
Solution Manual The Visual Story : Creating the Visual Structure of Film, TV and Digital Media (2nd Ed., Bruce Block)
Solution Manual The Shut Up and Shoot Documentary Guide : A Down & Dirty DV Production (Anthony Artis)
Solution Manual Portable Video : ENG & EFP (5th Ed., Medoff & Fink)
Solution Manual Voice and Vision : A Creative Approach to Narrative Film and DV Production (Mick Hurbis-Cherrier)
Solution Manual Writing for Multimedia and the Web : A Practical Guide to Content Development for Interactive Media (3rd Ed., Timothy Garrand)
Solution Manual Developing and Maintaining a Design-Tech Portfolio : A Guide for Theatre, Film & TV (Rafael Jaen)
Solution Manual Producing for TV and Video : A Real-World Approach (Cathrine Kellison)
Solution Manual Producing for TV and New Media : A Real-World Approach for Producers (2nd Ed., Cathrine Kellison)
Solution Manual Placing Shadows : Lighting Techniques for Video Production (3rd Ed., Gloman & Tom LeTourneau)
Solution Manual Film Directing Fundamentals : See Your Film Before Shooting (3rd Ed., Nicholas Proferes)
Solution Manual Introduction to Media Production : The Path to Digital Media Production (3rd Ed., Musburger & Kindem)
Solution Manual Introduction to Media Production : The Path to Digital Media Production (4th Ed., Kindem & Musburger)
Solution Manual Directing the Documentary (5th Ed., Michael Rabiger)
Solution Manual Video Production Handbook (4th Ed., Gerald Millerson & Jim Owens)
Solution Manual Making Media : Foundations of Sound and Image Production (Jan Roberts-Breslin)
Solution Manual Prepare to Board! Creating Story and Characters for Animation Features and Shorts (Nancy Beiman)
Solution Manual Light and Lens : Photography in the Digital Age (Robert Hirsch)
Solution Manual The Radio Station : Broadcast, Satellite & Internet (7th Ed., Michael Keith)
Solution Manual Developing Story Ideas (2nd Ed., Michael Rabiger)
Solution Manual Radio Production Worktext : Studio and Equipment (5th Ed., Reese, Gross & Gross)
Solution Manual Broadcast News Writing, Reporting, and Producing (4th Ed., Ted White)
Solution Manual Problem Solving and Programming Concepts (7th Ed., Sprankle)
Solution Manual Problem Solving and Programming Concepts (8th Ed., Sprankle & Hubbard)

Solution Manual A Balanced Introduction to Computer Science (2nd Ed., David Reed)
Solution Manual Introduction to Computing and Programming with Java : A Multimedia Approach (Guzdial & Ericson)
Solution Manual Starting Out with Programming Logic and Design (Tony Gaddis)
Solution Manual Starting Out with Programming Logic and Design (2nd Ed., Tony Gaddis)
Solution Manual Tools For Structured and Object-Oriented Design (7th Ed., Bohl & Rynn)
Solution Manual Programming with Alice and Java (Lewis & DePasquale)
Solution Manual e-Business and e-Commerce How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual XML How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto, Ted Lin, Praveen Sadhu)
Solution Manual Python How to Program (Harvey M. Deitel, Paul J. Deitel, Jonathan P. Liperi Ben Wiedermann)
Solution Manual Perl How to Program (Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto, D. C. McPhie)
Solution Manual C How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual C How to Program (5th Ed., Harvey & Paul Deitel)
Solution Manual C++ How to Program (6th Ed., Harvey & Paul Deitel)
Solution Manual Visual Basic.NET How to Program (2nd Ed., Harvey M. Deitel, Paul J. Deitel, Tem R. Nieto)
Solution Manual Visual C++ 2008 How to Program (2nd Ed., Harvey & Paul Deitel)
Solution Manual Internet & World Wide Web : How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual Web Technologies : A Computer Science Perspective (Jeffrey C. Jackson)
Solution Manual Mastering the Internet, XHTML and JavaScript (2nd Ed., Ibrahim Zeid)
Solution Manual Weaving a Website : Programming in HTML, Java Script, Perl and Java (Susan Anderson-Freed)
Solution Manual Simply C++ : An Application-Driven Tutorial Approach (Harvey & Paul Deitel)
Solution Manual Visual C# 2005 How to Program (2nd Ed., Harvey & Paul Deitel)
Solution Manual Visual C# 2008 How to Program (3rd Ed., Harvey & Paul Deitel)
Solution Manual Visual C# 2010 How to Program (4th Ed., Harvey & Paul Deitel)
Solution Manual Simply C# : An Application-Driven Tutorial Approach (Harvey & Paul Deitel, Hoey & Yaeger)
Solution Manual Java : An Introduction to Problem Solving and Programming (4th Ed., Walter Savitch)
Solution Manual Java : An Introduction to Problem Solving and Programming (5th Ed., Savitch & Carrano)
Solution Manual Introduction to Computing and Programming with Java : A Multimedia Approach (Guzdial & Ericson)
Solution Manual Java How to Program (7th Ed., Harvey & Paul Deitel)
Solution Manual Java For Students (5th Ed., Bell & Parr)
Solution Manual Java, Java, Java, Object-Oriented Problem Solving (3rd

Ed., Morelli & Walde)
Solution Manual Java : An Eventful Approach (Bruce, Danyluk & Murtagh)
Solution Manual Introduction to Java Programming with JBuilder (3rd Ed., Y. Daniel Liang)
Solution Manual Starting Out with Visual Basic 2008 (4th Ed., Gaddis & Irvine)
Solution Manual Starting Out with Visual Basic 2010 (5th Ed., Gaddis & Irvine)
Solution Manual Starting Out with Python (Tony Gaddis)
Solution Manual Object-Oriented Programming in Python (Goldwasser & Letscher)
Solution Manual Introduction to MathCAD 11 (Ronald W. Larsen)
Solution Manual Introduction to MathCAD 13 (2nd Ed., Ronald W. Larsen)
Solution Manual MatLAB Programming (David Kuncicky)
Solution Manual Introduction to Maple 8 (David Schwartz)
Solution Manual Introduction to FORTRAN 90 (2nd Ed., Larry R. Nyhoff & Sanford Leestma)
Solution Manual Fortran 95/2003 Scientists and Engineers (3rd Ed., Stephen J. Chapman)
Solution Manual Introduction to Java (Stephen J. Chapman)
Solution Manual Java Software Solutions for AP Computer Science A (2nd Ed., Lewis, Loftus & Cocking)
Solution Manual Business Data Networks and Telecommunications (6th Ed., Raymond R. Panko)
Solution Manual Business Data Networks and Telecommunications (7th Ed., Raymond R. Panko)
Solution Manual Business Data Communications (Allen Dooley)
Solution Manual Object-Oriented Programming in C++ (4th Ed., Robert Lafore)
Solution Manual C++ : Classes and Data Structures (Jeffrey Childs)
Solution Manual Data Structures Outside-In with Java (Sesh Venugopal)
Solution Manual Data Structures and Abstractions with Java (2nd Ed., Frank M. Carrano)
Solution Manual Data Structures and Algorithms in Java (Peter Drake)
Solution Manual Practical Introduction to Data Structures and Algorithm Analysis : C++ Edition (2nd Ed., Clifford A. Shaffer)
Solution Manual Computer Vision : A Modern Approach (David Forsyth & Jean Ponce)
Solution Manual Computer Graphics Using Java 2D and 3D (Hong Zhang & Y. Daniel Liang)
Solution Manual Computer Graphics Using OpenGL (3rd Ed., Francis Hill Jr. & Stephen Kelley)
Solution Manual Computer Graphics with OpenGL (3rd Ed., Donald Hearn & M. Pauline Baker)
Solution Manual User-Centered Web Site Development : A Human-Computer Interaction Approach (McCracken & Wolfe)
Solution Manual Fundamentals of Game Design (Ernest Adams & Andrew Rollings)
Solution Manual Introduction to The Game Industry (Moore & Sward)
Solution Manual Fundamentals of Math and Physics for Game Programmers (Wendy Stahler)
Solution Manual Usability Engineering : Process, Products & Examples (Laura Leventhal & Julie Barnes)

Solution Manual Web Usability : A User-Centered Design Approach (Jonathan Lazar)
Solution Manual Structured Computer Organization (5th Ed., Andrew S. Tanenbaum)
Solution Manual Assembly Language for Intel-Based Computers (5th Ed., Kip Irvine)
Solution Manual Assembly Language for x86 Processors (6th Ed., Kip R. Irvine)
Solution Manual Fundamentals of Multimedia (Ze-Nian Li & Mark Drew)
Solution Manual Digital Media Primer (Yue-Ling Wong)
Solution Manual Essentials for Design Macromedia Director MX 2004 Comprehensive (Tara Gray)
Solution Manual Modern Systems Analysis and Design (4th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Systems Analysis and Design (5th Ed., Jeffrey Hoffer, Joey George, & Joseph Valacich)
Solution Manual Modern Database Management (8th Ed., Hoffer, Prescott & Topi)
Solution Manual Modern Database Management (9th Ed., Hoffer, Prescott & Topi)
Solution Manual Database Systems Using Oracle (2nd Ed., Nilesh Shah)
Solution Manual An Advanced Course in Database Systems : Beyond Relational Databases (Dietrich & Urban)
Solution Manual Data and Text Mining : A Business Applications Approach (Thomas Miller)
Solution Manual Network Management : Concepts and Practice, A Hands-On Approach (J. Richard Burke)
Solution Manual Computer and Communication Networks (Nader F. Mir)
Solution Manual High Performance TCP/IP Networking (Mahbub Hassan & Raj Jain)
Solution Manual Computer Security : Principles and Practice (William Stallings & Lawrie Brown)
Solution Manual Computer Forensics : Principles and Practices (Volonino, Anzaldua & Godwin)
Solution Manual Disaster Recovery : Principles and Practices (April Wells, Charlyne Walker & Timothy Walker)
Solution Manual Firewalls and VPNs : Principles and Practices (Richard Tibbs & Edward Oakes)
Solution Manual Network Defense and Countermeasures : Principles and Practices (Chuck Easttom)
Solution Manual Corporate Computer and Network Security (1st Ed., Raymond Panko)
Solution Manual Corporate Computer and Network Security (2nd Ed., Raymond Panko)
Solution Manual IP Telephony Using CallManager Express Lab Portfolio (Cheryl Schmidt & Ernie Friend)
Solution Manual High-Speed Networks and Internets : Performance and Quality of Service (2nd Ed., William Stallings)
Solution Manual Object-Oriented Modeling and Design with UML (2nd Ed., Michael Blaha & James Rumbaugh)
Solution Manual Operating Systems : Internals and Design Principles (5th Ed., William Stallings)
Solution Manual Operating Systems : Internals and Design Principles

(6th Ed., William Stallings)
Solution Manual Distributed Systems : Principles and Paradigms (2nd Ed., Tanenbaum & Van Steen)
Solution Manual Modern Operating Systems (3rd Ed., Andrew Tanenbaum)
Solution Manual Computer Networks (4th Ed., Andrew S. Tanenbaum)
Solution Manual Computer Networks (5th Ed., Andrew S. Tanenbaum, David J. Wetherall)
Solution Manual Operating Systems Design and Implementation (3rd Ed., Andrew Tanenbaum & Albert Woodhull)
Solution Manual UNIX Unbounded : A Beginning Approach (5th Ed., Amir Afzal)
Solution Manual Introduction to Operating Systems and Networks (Ruth Watson)
Solution Manual Operating Systems (3rd Ed., Harvey Deitel, Paul Deitel & David Choffnes)
Solution Manual Operating Systems Principles (Lubomir Bic & Alan Shaw)
Solution Manual A Practical Guide to Linux : Commands, Editors, and Shell Programming (Mark Sobell)
Solution Manual A Practical Guide to Red Hat Linux : Fedora Core and Red Hat Enterprise Linux (2nd Ed., Mark Sobell)
Solution Manual A Practical Guide to Red Hat Linux : Fedora Core and Red Hat Enterprise Linux (3rd Ed., Mark Sobell)
Solution Manual A Practical Guide to Fedora and Red Hat Enterprise Linux: College Edition (Mark Sobell)
Solution Manual A Practical Guide to Ubuntu Linux (Mark Sobell)
Solution Manual Automata, Computability and Complexity : Theory and Applications (Elaine Rich)
Solution Manual Modern Digital Electronics (R.P. Jain)
Solution Manual Linear Systems and Signals (B.P. Lathi)
Solution Manual Modern Digital and Analog Communications Systems (3rd Ed., B. P. Lathi)
Solution Manual Introduction to Digital Systems (Milo D. Ercegovac, Lang & Moreno)
Solution Manual Embedded Systems : Architechture, Programming and Design (Raj Kamal)
Solution Manual Modern Power System Analysis (D. P. Kothari & I. J. Nagrath)
Solution Manual Basic Electrical Engineering (2nd Ed., D.P. Kothari, I.J. Nagrath)
Solution Manual Electric Machines (3rd Ed., D.P. Kothari, I.J. Nagrath)
Solution Manual Circuits and Networks (A. Sudhakar & S. Palli Shyammohan)
Solution Manual Electrical and Electronic Technology (9th Ed., Edward Hughes, John Hiley, Keith Brown & Ian McKenzie-Smith)
Solution Manual Electrical and Electronic Technology (10th Ed., Edward Hughes, John Hiley, Keith Brown & Ian McKenzie-Smith)
Solution Manual Electric Motors and Drives : Fundamentals, Types and Applications (3rd Ed., Austin Hughes)
Solution Manual Modern Processor Design : Fundamentals of Superscalar Processors (John P. Shen)
Solution Manual Computer Networks : Principles, Technologies and Protocols for Network Design (N. Olifer & V. Olifer)

Solution Manual Computer Networking : Internet Protocols in Action (Jeanna Matthews)
Solution Manual Computer Organization (5th Ed., Hamacher et al.)
Solution Manual CMOS Digital Integrated Circuits : Analysis and Design (3rd Ed., Sung-Mo Kang & Yusuf Leblebici)
Solution Manual Introduction to Logic Design (1st Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic Design (2nd Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic Design (3rd Ed., Alan B Marcovitz)
Solution Manual Introduction to Logic and Computer Design (Alan B Marcovitz)
Solution Manual Digital Principles and Design (Donald D. Givone)
Solution Manual Programmable Logic Controllers (3rd Ed., Frank Petruzella)
Solution Manual Programmable Logic Controllers (4th Ed., Frank Petruzella)

List of Solutions Manuals and Test Banks
----

contact me to :   mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR :   CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

- Math, Statistics & Probability :

Solution manual Advanced Engineering Mathematics (8th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (9th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (10th Ed., Erwin Kreyszig)
Solution manual Advanced Engineering Mathematics (2nd Ed, Michael Greenberg)
Solution manual Advanced Engineering Mathematics (6th Ed., Peter O'Neil)
Solution manual Advanced Modern Engineering Mathematics (3rd Ed., Glyn James)
Solution manual Modern Engineering Mathematics (4th Ed., Glyn James)
Solution manual Differential Equations and Dynamical Systems (3rd Ed., Lawrence Perko)
Solution manual Introductory Differential Equations with Boundary Value Problems (3rd Ed., Martha Abell & James Braselton)
Solution manual A Modern Introduction to Differential Equations (2nd Ed., Henry J. Ricardo)
Solution manual Elementary Differential Equations (7th Ed., Boyce)
Solution manual Elementary Differential Equations (8th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations (9th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (7th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (8th Ed., Boyce & Diprima)
Solution manual Elementary Differential Equations and Boundary Value Problems (9th Ed., Boyce & Diprima)
Solution manual Differential Equations : An Introduction to Modern Methods and Applications (James Brannan & William Boyce)
Solution manual Differential Equations with Boundary Value Problems : An Introduction to Modern Methods and Applications (James Brannan & William Boyce)
Solution manual Advanced Calculus : A Transition to Analysis (Thomas

Dence & Joseph Dence)
Solution manual Calculus : Early Transcendentals Combined (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Combined (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Multivariable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Multivariable (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Single Variable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Early Transcendentals Single Variable (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Combined (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Combined (9th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Single Variable (8th Ed., Anton, Bivens & Davis)
Solution manual Calculus : Late Transcendentals Single Variable (9th Ed., Anton, Bivens & Davis)
Solution manual Introduction to the Finite Element Method : Theory, Programming and Applications (Erik G. Thompson)
Solution manual A Physicist's Guide to Mathematica (2nd Ed., Patrick Tam)
Solution manual Mathematics for Engineers : A Modern Interactive Approach (3rd., Anthony Croft & Robert Davison)
Solution manual Measurement and Data Analysis for Engineering and Science (Patrick F Dunn)
Solution manual Elementary Linear Algebra (4th Ed., Stephen Andrilli & David Hecker)
Solution manual Elementary Linear Algebra Edition Abridged (9th Ed., Anton & Rorres)
Solution manual Elementary Linear Algebra (9th Ed., Anton)
Solution manual Elementary Linear Algebra with Applications (9th Ed., Anton & Rorres)
Solution manual Boundary Value Problems and Partial Differential Equations (6th Ed., David Powers)
Solution manual Introductory Statistics : Using Technology (5th Ed., Prem S. Mann)
Solution manual Introductory Statistics (6th Ed., Prem S. Mann)
Solution manual Introductory Statistics (7th Ed., Prem S. Mann)
Solution manual Basic Real Analysis (Houshang H. Sohrab)
Solution manual Modern Algebra : An Introduction (6th Ed., John Durbin)
Solution manual The Art and Craft of Problem Solving (2nd Ed., Paul Zeitz)
Solution manual Numerical Linear Algebra (Gr=E9goire Allaire, Sidi Mahmoud Kaber, K. Trabelsi)
Solution manual Introductory Statistics for the Behavioral Sciences (6th Ed., Welkowitz, Cohen & Ewen)
Solution manual Statistics : Principles and Methods (5th Ed., Richard Johnson)

Solution manual Statistics : Principles and Methods (6th Ed., Richard Johnson)
Solution manual Statistical Bioinformatics : with R (Sunil K. Mathur)
Solution manual Parameter Estimation and Inverse Problems (Richard Aster, Brian Borchers & Clifford Thurber)
Solution manual Codes : An Introduction to Information Communication and Cryptography (Norman L. Biggs)
Solution manual Geometry and Its Applications (2nd Ed., Walter A. Meyer)
Solution manual Elementary Differential Geometry (2nd Ed., A.N. Pressley)
Solution manual Fractal Geometry : Mathematical Foundations and Applications (2nd Ed., Kenneth Falconer)
Solution manual Analytical and Computational Methods of Advanced Engineering Mathematics (Grant B. Gustafson & Calvin H. Wilcox)
Solution manual How to Read and Do Proofs : An Introduction to Mathematical Thought Processes (4th Ed., Daniel Solow)
Solution manual How to Read and Do Proofs : An Introduction to Mathematical Thought Processes (5th Ed., Daniel Solow)
Solution manual A Probability Path (Sidney Resnick)
Solution manual Intuitive Probability and Random Processes using MATLAB (Steven Kay)
Solution manual Modeling Random Processes for Engineers and Managers (James Solberg)
Solution manual Probability and Random Processes with Applications to Signal Processing (3rd Ed., Henry Stark & John W. Woods)
Solution manual Probability, Statistics, and Random Processes For Electrical Engineering (3rd Ed., Alberto Leon-Garcia)
Solution manual Probability Concepts in Engineering : Emphasis on Applications to Civil and Environmental Engineering (2nd Ed., Ang & Tang)
Solution manual Applied Statistics for Engineers and Physical Scientists (3rd Ed., Johannes Ledolter & Robert Hogg)
Solution manual Applied Statistics and Probability for Engineers (3rd Ed., Montgomery & Runger)
Solution manual Applied Statistics and Probability for Engineers (4th Ed., Montgomery & Runger)
Solution manual Applied Statistics and Probability for Engineers (5th Ed., Montgomery & Runger)
Solution manual Engineering Statistics (3rd Ed., Montgomery, Runger & Hubele)
Solution manual Engineering Statistics (4th Ed., Montgomery, Runger & Hubele)
Solution manual Engineering Statistics (5th Ed., Montgomery, Runger & Hubele)
Solution manual Introduction to Statistical Quality Control (5th Ed., Montgomery)
Solution manual Introduction to Statistical Quality Control (6th Ed., Montgomery)
Solution manual Calculus : One Variables (10th Ed., Salas, Hille, Etgen)
Solution manual Calculus : One and Several Variables (8th Ed., Salas, Hille, Etgen)

Solution manual Calculus : One and Several Variables (10th Ed., Salas, Hille, Etgen)
Solution manual Squaring the Circle : Geometry in Art and Architecture (Paul Calter)
Solution manual Technical Mathematics (5th Ed., Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus (5th Ed., Paul Calter & Michael Calter)
Solution manual Technical Mathematics with Calculus, Canadian Edition (Paul Calter & Michael Calter)
Solution manual Techniques of Problem Solving (Luis Fern=E1ndez, Haedeh Gooransarab)
Solution manual Probability and Statistics in Engineering (4th Ed., Hines, Montgomery, Goldsman & Borror)
Solution manual A First Course in Design and Analysis of Experiments (Gary W. Oehlert)
Solution manual Design and Analysis of Experiments (6th Ed., Douglas Montgomery)
Solution manual Design and Analysis of Experiments (7th Ed., Douglas Montgomery)
Solution manual Introduction to Engineering Experimentation (2nd Ed., Wheeler & Ganji)
Solution manual Introduction to Engineering Experimentation (3rd Ed., Wheeler & Ganji)
Solution manual Introduction to the Design & Analysis of Experiments (Canavos & Koutrouvelis)
Solution manual Modern Methods For Quality Control and Improvement (2nd Ed., Wadsworth, Stephens, Godfrey)
Solution manual Essential Statistics for Economics, Business and Management (Teresa Bradley)
Solution manual Statistics and Econometrics : Methods and Applications (Ashenfelter, Levine & Zimmerman)
Solution manual Applied Combinatorics (5th Ed., Alan Tucker)
Solution manual Vector Calculus (Miroslav Lovric)
Solution manual Applied Multivariate Techniques (Subhash Sharma)
Solution manual Mathematical Modeling (3rd Ed., Mark Meerschaert)
Solution manual Discrete Mathematics : Mathematical Reasoning and Proof with Puzzles, Patterns, and Games (Douglas Ensley, J. Winston Crawley)
Solution manual Probability, Random Variables and Random Signal Principles (4th Ed., Peyton Z., Jr. Peebles)
Solution manual Introduction to C++, Excel MATLAB & Basic Engineering Numerical Methods V1.1 (Harvey Stenger & Charles Smith)
Solution manual Numerical Methods for Engineers and Scientists : An Introduction with Applications Using MATLAB (1st Ed., Amos Gilat & Vish Subramaniam)
Solution manual Numerical Methods for Engineers and Scientists : An Introduction with Applications Using MATLAB (2nd Ed., Amos Gilat & Vish Subramaniam)
Solution manual MATLAB : An Introduction with Applications (2nd Ed., Amos Gilat)
Solution manual MATLAB : An Introduction with Applications (3rd Ed., Amos Gilat)

Solution manual MATLAB : An Introduction with Applications (4th Ed., Amos Gilat)
Solution manual Matlab : A Practical Introduction to Programming and Problem Solving (Stormy Attaway)
Solution manual Data, Statistics, and Decision Models with Excel (Harnett & Horrell)
Solution manual Understanding Analysis (Stephen Abbott)
Solution manual Time Series Analysis With Applications in R (2nd Ed., Jonathan D. Cryer & Kung-Sik Chan)
Solution manual Time Series Analysis and Its Applications : With R Examples (2nd Ed., Robert Shumway & David Stoffer)
Solution manual Doing Statistics for Business with Excel : Data, Inference, and Decision Making (2nd Ed. Pelosi & Sandifer)
Solution manual Engineering with Excel (3rd Ed., Ronald W. Larsen)
Solution manual Spreadsheet Tools for Engineers Using Excel 2007 (Byron Gottfried)
Solution manual Spreadsheet Tools for Engineers using Excel (2nd Ed. Byron Gottfried)
Solution manual Spreadsheet Tools for Engineers using Excel (3rd Ed. Byron Gottfried)
Solution manual Introduction to Matlab 7 (Etter, Kuncicky & Moore)
Solution manual Introduction to Matlab 6 for Engineers (1st Ed., William Palm III)
Solution manual Introduction to Matlab 7 for Engineers (2nd Ed., William Palm III)
Solution manual Introduction to Matlab for Engineers (3rd Ed., William Palm III)
Solution manual A Concise Introduction to MATLAB (William J Palm III)
Solution manual Numerical Methods for Engineers (4th Ed. Steven Chapra, Raymond Canale)
Solution manual Numerical Methods for Engineers (5th Ed. Steven Chapra, Raymond Canale)
Solution manual Numerical Methods for Engineers (6th Ed. Steven Chapra, Raymond Canale)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (1st Ed., Steven Chapra)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (2nd Ed., Steven Chapra)
Solution manual Applied Numerical Methods with MATLAB for Engineers and Scientists (3rd Ed., Steven Chapra)
Solution manual MATLAB for Engineers (1st Ed., Holly Moore)
Solution manual MATLAB for Engineers (2nd Ed., Holly Moore)
Solution manual Statistics for Engineers and Scientists (1st Ed., William Navidi)
Solution manual Statistics for Engineers and Scientists (2nd Ed., William Navidi)
Solution manual Statistics for Engineers and Scientists (3rd Ed., William Navidi)
Solution manual Principles of Statistics for Engineers and Scientists (William Navidi)
Solution manual Probability (Jim Pitman)
Solution manual Basic Probability Theory (Robert B. Ash)
Solution manual An Introduction to Stochastic Modeling (3rd Ed.,

Samuel Karlin)
Solution manual Stochastic Calculus for Finance (Steven E. Shreve)
Solution manual Markov Processes for Stochastic Modeling (Oliver Ibe)
Solution manual Mathematical Statistics with Applications (K.M. Ramachandran & Chris Tsokos)
Solution manual Probability : A Graduate Course (Allan Gut)
Solution manual Linear Algebra Done Right (2nd Ed., Sheldon Axler)
Solution manual Precalculus : A Prelude to Calculus (Sheldon Axler)
Solution manual Statistics for Business (Derek Waller)
Solution manual An Introduction to the Mathematics of Financial Derivatives (2nd Ed., Salih Neftci)
Solution manual Elementary Number Theory with Applications (2nd Ed., Thomas Koshy)
Solution manual Introduction to Probability Models (9th Ed., Sheldon Ross)
Solution manual Introduction to Probability Models (10th Ed., Sheldon Ross)
Solution manual Introductory Statistics (2nd Ed., Sheldon Ross)
Solution manual Introductory Statistics (3rd Ed., Sheldon Ross)
Solution manual Introduction to Probability and Statistics for Engineers and Scientists (4th Ed., Sheldon Ross)
Solution manual Basic Mathematics through Applications (4th Ed. by Akst, Bragg)
Solution manual Developmental Mathematics (6th Ed., Bittinger & Beecher)
Solution manual Developmental Mathematics (7th Ed., Bittinger & Beecher)
Solution manual Developmental Mathematics : Basic Mathematics and Algebra (1st Ed., Lial, Hornsby, McGinnis, Salzman & Hestwood)
Solution manual Developmental Mathematics : Basic Mathematics and Algebra (2nd Ed., Lial, Hornsby, McGinnis, Salzman & Hestwood)
Solution manual Essential Mathematics (2nd Ed., Margaret Lial & Stanley Salzman)
Solution manual Essential Mathematics (3rd Ed., Margaret Lial & Stanley Salzman)
Solution manual Prealgebra & Introductory Algebra (2nd Ed. by Elayn El Martin-Gay)
Solution manual Prealgebra (5th Ed., Bittinger, Ellenbogen & Johnson)
Solution manual Prealgebra (5th Ed., Elayn El Martin-Gay)
Solution manual Prealgebra : An Integrated Approach (Lial & Hestwood)
Solution manual Integrated Arithmetic and Basic Algebra (4th Ed., Jordan & Palow)
Solution manual Introductory Algebra through Applications (1st Ed., Akst & Bragg)
Solution manual Introductory Algebra through Applications (2nd Ed., Akst & Bragg)
Solution manual Beginning Algebra (10th Ed., Lial, Hornsby & McGinnis)
Solution manual Elementary Algebra Early Graphing for College Students (3rd Ed., Allen R. Angel)
Solution manual Intermediate Algebra with Applications & Visualization (3rd Ed., Rockswold & Krieger)
Solution manual Intermediate Algebra (10th Ed., Lial, Hornsby & McGinnis)

Solution manual Beginning and Intermediate Algebra (4th Ed., Lial, Hornsby & McGinnis)
Solution manual Elementary and Intermediate Algebra : Graphs & Models (3rd Ed., Bittinger, Ellenbogen & Johnson)
Solution manual Algebra for College Students (4th Ed., Mark Dugopolski)
Solution manual Algebra for College Students (5th Ed., Mark Dugopolski)
Solution manual Algebra For College Students (6th Ed., Robert F Blitzer)
Solution manual Algebra for College Students (3rd Ed., Allen R. Angel)
Solution manual Algebra for College Students (6th Ed., Lial, Hornsby & McGinnis)
Solution manual Statistics, Data Analysis, and Decision Modeling (3rd Ed., James Evans)
Solution manual Statistics, Data Analysis, and Decision Modeling (4th Ed., James Evans)
Solution manual College Geometry : A Discovery Approach (2nd Ed., David Kay)
Solution manual College Geometry : Using The Geometer's Sketchpad - Preliminary Edition (Barbara Reynolds & William Fenton)
Solution manual College Geometry : A Problem Solving Approach with Applications (2nd Ed., Musser, Trimpe & Maurer)
Solution manual A Survey of Mathematics with Applications (8th Ed., Angel, Abbott & Runde)
Solution manual A Survey of Mathematics with Applications: Expanded Edition (8th Ed., Angel, Abbott & Runde)
Solution manual Mathematical Ideas (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas: Expanded Edition (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Thinking : Problem-Solving and Proofs (2nd Ed., John P. D'Angelo & Douglas B. West)
Solution manual Thinking Mathematically (4th Ed., Robert F. Blitzer)
Solution manual Introduction to Mathematical Thinking: Algebra and Number Systems (Will J. Gilbert & Scott A. Vanstone)
Solution manual Mathematical Reasoning : Writing and Proof (1st Ed., Ted A. Sundstrom)
Solution manual Mathematical Reasoning : Writing and Proof (2nd Ed., Ted A. Sundstrom)
Solution manual Mathematical Reasoning for Elementary Teachers (4th Ed., Calvin T. Long & Duane W. DeTemple)
Solution manual Mathematical Reasoning for Elementary Teachers (5th Ed., Long, DeTemple & Millman)
Solution manual Mathematics for Elementary School Teachers (4th Ed., O'Daffer, Charles, Cooney, Dossey & Schielack)
Solution manual Mathematics for Elementary Teachers (2nd Ed., Sybilla Beckmann)
Solution manual Finite Mathematics and Calculus with Applications (7th Ed., Lial, Greenwell & Ritchey)
Solution manual Finite Mathematics and Calculus with Applications (8th Ed., Lial, Greenwell & Ritchey)
Solution manual Additional Calculus Topics (11th Ed., Barnett, Ziegler

& Byleen)
Solution manual College Mathematics for Business, Economics, Life Sciences & Social Sciences (11th Ed., Barnett, Ziegler & Byleen)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and Social Sciences (12th Ed., Haeussler, Paul & Wood)
Solution manual Finite Mathematics for Business, Economics, Life Sciences and Social Sciences (11th Ed., Barnett, Ziegler, Byleen)
Solution manual Finite Mathematics (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Calculus and Its Applications (9th Ed., Bittinger & Ellenbogen)
Solution manual Calculus for Business, Economics, Life Sciences & Social Sciences (11th Ed., Barnett, Ziegler & Byleen)
Solution manual Calculus with Applications (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Calculus with Applications : Brief Version (9th Ed., Lial, Greenwell & Ritchey)
Solution manual Concepts of Calculus with Applications (Martha Goshaw)
Solution manual University Calculus : Elements with Early Transcendentals (Hass, Weir & Thomas, Jr.)
Solution manual Thomas' Calculus, Early Transcendentals: Media Upgrade (11th Ed., Thomas Jr., Weir, Hass & Giordano)
Solution manual Thomas' Calculus: Media Upgrade (11th Ed., Thomas Jr., Weir, Hass & Giordano)
Solution manual University Calculus : Alternate Edition (Hass, Weir & Thomas, Jr.)
Solution manual Differential Equations Computing and Modeling (4th Ed., Edwards & Penney)
Solution manual Differential Equations and Boundary Value Problems : Computing and Modeling (4th Ed., Edwards & Penney)
Solution manual Elementary Differential Equations with Boundary Value Problems (6th Ed., Edwards & Penney)
Solution manual Elementary Differential Equations (6th Ed., Edwards & Penney)
Solution manual Fundamentals of Differential Equations (7th Ed., Nagle, Saff & Snider)
Solution manual Fundamentals of Differential Equations with Boundary Value Problems (5th Ed., Nagle, Saff & Snider)
Solution manual Differential Equations and Linear Algebra (3rd Ed., Goode & Annin)
Solution manual Discrete Mathematical Structures (6th Ed., Kolman, Busby & Ross)
Solution manual College Algebra Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual College Algebra (10th Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra : Graphs and Models (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual College Algebra Essentials (8th Ed., Michael Sullivan)
Solution manual College Algebra (3rd Ed., Judith A. Beecher, Judith A. Penna & Marvin L. Bittinger)
Solution manual College Algebra (8th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry for College Readiness

(Margaret L. Lial & John Hornsby)
Solution manual Algebra and Trigonometry Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual Algebra and Trigonometry : Graphs & Models (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Trigonometry : A Unit Circle Approach (8th Ed., Michael Sullivan)
Solution manual Precalculus (3rd Ed., Lial, Hornsby & Schneider)
Solution manual Precalculus (4th Ed., Lial, Hornsby & Schneider)
Solution manual Precalculus : Enhanced with Graphing Utilities (5th Ed., Sullivan & Sullivan III)
Solution manual Precalculus : Functions and Graphs (3rd Ed. Mark Dugopolski)
Solution manual Precalculus : Graphs & Models and Graphing (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Discrete and Combinatorial Mathematics (5th ed., Ralph P. Grimaldi)
Solution manual Discrete Mathematics (Sherwood Washburn, Thomas Marlowe & Charles T. Ryan)
Solution manual Discrete Mathematics (5th ed., John Dossey, Albert Otto, Lawrence Spence & Charles Vanden Eynden)
Solution manual Mathematics for New Technologies (Don Hutchison & Mark Yannotta)
Solution manual Fundamental Finite Element Analysis and Applications: with Mathematica and Matlab Computations (Asghar Bhatti)
Solution manual Advanced Topics in Finite Element Analysis of Structures: With Mathematica and MATLAB Computations (Asghar Bhatti)
Solution manual The Finite Element Method in Engineering (4th Ed., by Rao)
Solution manual An Introduction to the Finite Element Method (3rd Ed., J. N. Reddy)
Solution manual Fundamentals of Finite Element Analysis (1st Ed., David V. Hutton)
Solution manual Simulation Modeling and Analysis (3rd Ed., Averill Law & David Kelton)
Solution manual Simulation Modeling and Analysis (4th Ed., Averill Law)
Solution manual The Finite Element Method : Its Basis and Fundamentals (6th Ed., Zienkiewicz, R. L. Taylor & J.Z. Zhu)
Solution manual Algebra : Form and Function (William McCallum, Eric Connally & Deborah Hughes-Hallett)
Solution manual Algebra : Form and Function, Preliminary Edition (William McCallum, Eric Connally & Deborah Hughes-Hallett)
Solution manual Applied Calculus (2nd Ed., Deborah Hughes-Hallett, et al.)
Solution manual Applied Calculus (3rd Ed., Deborah Hughes-Hallett, et al.)
Solution manual Applied Calculus (4th Ed., Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (3rd Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Multivariable (4th Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)

Solution manual Calculus : Multivariable (5th Ed., William G. McCallum, Deborah Hughes-Hallett, et al.)
Solution manual Calculus : Single Variable (3rd Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single Variable (4th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single Variable (5th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (3rd Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (4th Ed., Deborah Hughes-Hallett, Andrew M. Gleason, et al.)
Solution manual Calculus : Single and Multivariable (5th Ed., Deborah Hughes-Hallett)
Solution manual Functions Modeling Change : A Preparation for Calculus - Texas Edition (2nd Ed., Eric Connally, Deborah Hughes-Hallett & Andrew M. Gleason)
Solution manual Functions Modeling Change : A Preparation for Calculus (2nd Ed., Eric Connally, Deborah Hughes-Hallett, et al.)
Solution manual Functions Modeling Change : A Preparation for Calculus (3rd Ed., Eric Connally)
Solution manual Differential Equations (A. King, J. Billingham, S. Otto)
Solution manual Regression Methods in Biostatistics : Linear, Logistic, Survival, and Repeated Measures Models (Eric Vittinghoff, David Glidden, Stephen Shiboski, Charles McCulloch)
Solution manual A Modern Introduction to Probability and Statistics : Understanding Why and How (F.M. Dekking, C. Kraaikamp, H.P. Lopuha=E4, L.E. Meester)
Solution manual Statistical Methods for the Analysis of Repeated Measurements (Charles S. Davis)
Solution manual Bayesian Core : A Practical Approach to Computational Bayesian Statistics (Jean-Michel Marin, Christian Robert)
Solution manual The Bayesian Choice : From Decision-Theoretic Foundations to Computational Implementation (2nd Ed., Christian Robert)
Solution manual Essentials of Stochastic Processes (Rick Durrett)
Solution manual Methods of Multivariate Statistics (Muni Srivastava)
Solution manual Regression Analysis : Theory, Methods, and Applications (Ashish Sen & Muni Srivastava)
Solution manual Applied Probability and Statistics (Mario Lefebvre)
Solution manual Basic Probability Theory with Applications (Mario Lefebvre)
Solution manual Foundations of Hyperbolic Manifolds (2nd Ed., John Ratcliffe)
Solution manual Fourier and Laplace Transforms (R. J. Beerends , H. G. ter Morsche)
Solution manual Infinite-Dimensional Dynamical Systems (James C. Robinson)
Solution manual Mathematical Methods for Physics and Engineering, (3rd Ed., Riley, Hobson & Bence)
Solution manual Numerical Methods in Engineering with MATLAB (Jaan Kiusalaas)

```
Solution manual Numerical Methods in Engineering with Python (Jaan
Kiusalaas)
Solution manual An Introduction to Numerical Analysis (Endre Suli and
David Mayers)
Solution manual Fundamentals of Engineering Numerical Analysis
(Parviz Moin)
Solution manual Statistical Design (George Casella)
Solution manual Statistical Inference (2nd Ed., George Casella, Roger
L. Berger)
Solution manual Monte Carlo Statistical Methods (2nd Ed., Christian P.
Robert, George Casella)
Solution manual Introducing Monte Carlo Methods with R (Christian
Robert & George Casella)
Solution manual Introduction to Mathematical Structures and Proofs
(Larry J. Gerstein)
Solution manual Analyzing Categorical Data (Jeffrey S. Simonoff)
Solution manual Fundamentals of Complex Analysis with Applications to
Engineering, Science, and Mathematics (3rd Ed., E. Saff & Arthur
Snider)
Solution manual Probability & Statistics for Engineers & Scientists
(8th Ed., Walpole, Myers, Ye)
Solution manual Probability & Statistics for Engineers & Scientists
(9th Ed., Walpole, Myers, Ye)
Solution manual Statistics for Engineering and the Sciences (5th Ed.,
Mendenhall & Sincich)

List of Solutions Manuals and Test Banks

contact me to :   mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR :   CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

- Math, Statistics & Probability :

Solution manual A Second Course in Statistics : Regression Analysis (6th Ed., Mendenhall & Sincich)
Solution manual A Second Course in Statistics : Regression Analysis (7th Ed., Mendenhall & Sincich)
Solution manual Miller & Freund's Probability and Statistics for Engineers (7th Ed., Johnson, Miller, Freund)
Solution manual Miller & Freund's Probability and Statistics for Engineers (8th Ed., Johnson, Miller, Freund)
Solution manual Numerical Methods Using Matlab (4th Ed., Mathews & Fink)
Solution manual Applied Numerical Analysis Using MATLAB (2nd Ed., Laurene v. Fausett)
Solution manual Applied Numerical Analysis (7th Ed., Curtis F. Gerald, Patrick O. Wheatley)
Solution manual Friendly Introduction to Numerical Analysis (Bradie)
Solution manual Elementary Linear Algebra (2nd Ed., Spence, Insel & Friedberg)
Solution manual Elementary Linear Algebra with Applications (9th Ed., Kolman & Hill)
Solution manual Introductory Linear Algebra : An Applied First Course (8th Ed., Kolman & Hill)
Solution manual Linear Algebra with Applications (6th Ed., S. Leon)
Solution manual Linear Algebra with Applications (7th Ed., S. Leon)
Solution manual Linear Algebra for Engineers and Scientists Using Matlab (Hardy)
Solution manual Linear Algebra with Applications (3rd Ed., Bretscher)
Solution manual Linear Algebra with Applications (4th Ed., Bretscher)
Solution manual Modern Matrix Algebra (Hill & Kolman)
Solution manual Matrix Methods : Applied Linear Algebra (3rd Ed., Richard Bronson & Gabriel B. Costa)

Solution manual A Transition to Abstract Mathematics : Learning Mathematical Thinking and Writing (2nd Ed., Randall Maddox)
Solution manual Partial Differential Equations and Boundary Value Problems with Fourier Series (2nd ed., Asmar)
Solution manual Applied Partial Differential Equations (4th Ed., Haberman)
Solution manual Technical Calculus (5th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Technical Mathematics (2th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Technical Mathematics with Calculus (2th Ed., Dale Ewen, Joan S. Gary & James E. Trefzger)
Solution manual Introductory Mathematics (4th Ed., Cook)
Solution manual Mathematics for the Technical Trades (Cook)
Solution manual College Mathematics (7th Ed., Cleaves & Hobbs)
Solution manual Fundamentals of Statistics (2nd Ed., Michael III Sullivan)
Solution manual Fundamentals of Statistics (3rd Ed., Michael III Sullivan)
Solution manual Statistics : Informed Decisions Using Data (2nd Ed., Michael III Sullivan)
Solution manual Modern Elementary Statistics (12th Ed., John E. Freund, Benjamin M. Perles)
Solution manual Statistics : The Art and Science of Learning From Data (Agresti & Franklin)
Solution manual Statistics : The Art and Science of Learning From Data (2nd Ed., Agresti & Franklin)
Solution manual Elementary Statistics : Picturing the World (3rd Ed., Larson & Farber)
Solution manual Elementary Statistics : Picturing the World (4th Ed., Larson & Farber)
Solution manual Elementary Statistics : Picturing the World (5th Ed., Larson & Farber)
Solution manual A First Course in Statistics (9th Ed., McClave & Sincich)
Solution manual A First Course in Statistics (10th Ed., McClave & Sincich)
Solution manual Statistics (10th Ed., McClave & Terry Sincich)
Solution manual Statistics (11th Ed., McClave & Terry Sincich & William Mendenhall)
Solution manual Interactive Statistics (3rd Ed., Martha Aliaga & Brenda Gunderson)
Solution manual Statistics for the Life Sciences (3rd Ed., Samuels & Witmer)
Solution manual Statistics for the Life Sciences (4th Ed., Samuels, Witmer & Schaffner)
Solution manual Applied Statistics and the SAS Programming Language (5th Ed., Cody & Smith)
Solution manual Biostatistics for the Health Sciences (R. Clifford Blair & Richard Taylor)
Solution manual Biostatistics : How It Works (Steve Selvin)
Solution manual Business Statistics : First Course (4th Ed., Levine, Krehbiel & Berenson)

Solution manual Business Statistics : First Course (5th Ed., Levine, Krehbiel & Berenson)
Solution manual Course in Business Statistics (4th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision Making Approach (6th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision-Making Approach (7th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Business Statistics : A Decision-Making Approach (8th Ed., Groebner, Shannon, Fry & Smith)
Solution manual Statistics for Business & Economics (10th Ed., McClave, Benson & Sincich)
Solution manual Statistics for Managers Using Excel (5th Ed., Levine)
Solution manual Statistics for Managers Using Microsoft Excel (4th Ed., Levine, Stephan, Krehbiel & Berenson)
Solution manual Statistics for Business and Economics (5th Ed., Newbold, Carlson & Thorne)
Solution manual Statistics for Business and Economics (6th Ed., Newbold, Carlson & Thorne)
Solution manual Statistics for Business and Economics (7th Ed., Newbold, Carlson & Thorne)
Solution manual Basic Business Statistics : Concepts and Applications (10th Ed., Berenson, Krehbiel & Levine)
Solution manual Basic Business Statistics (11th Ed., Berenson, Levine & Krehbiel)
Solution manual John E. Freund's Mathematical Statistics with Applications (7th Ed., Miller)
Solution manual Probability and Statistical Inference (7th Ed., Hogg & Tanis)
Solution manual Probability and Statistical Inference (8th Ed., Hogg & Tanis)
Solution manual Introduction to Mathematical Statistics (6th Ed., Hogg, Craig & McKean)
Solution manual Introduction to Mathematical Statistics and Its Applications (4th Ed., Larsen & Marx)
Solution manual Introduction to Mathematical Statistics and Its Applications (5th Ed., Larsen & Marx)
Solution manual A Brief Course in Mathematical Statistics (Hogg & Tanis)
Solution manual Fundamentals of Probability, with Stochastic Processes (3rd Ed., Saeed Ghahramani)
Solution manual A First Course in Probability (7th Ed., Sheldon Ross)
Solution manual A First Course in Probability (8th Ed., Sheldon Ross)
Solution manual Applied Multivariate Statistical Analysis (6th Ed., Johnson & Wichern)
Solution manual Multivariate Data Analysis (6th Ed., Hair, Black, Babin, Anderson & Tatham)
Solution manual Multivariate Data Analysis (7th Ed., Hair, Black, Babin, Anderson)
Solution manual Essential MATLAB for Engineers and Scientists (3rd Ed., Brian Hahn & Dan Valentine)
Solution manual Essential MATLAB for Engineers and Scientists (4th Ed., Brian Hahn & Dan Valentine)

Solution manual Introduction to Applied Statistical Signal Analysis : Guide to Biomedical and Electrical Engineering Applications (3rd Ed. Richard Shiavi)
Solution manual Construction Mathematics (Surinder Virdi & Roy Baker)
Solution manual Numerical Methods in Biomedical Engineering (Stanley Dunn, Alkis Constantinides & Prabhas Moghe)
Solution manual Probability and Statistics with Integrated Software Routines (Ronald Deep)
Solution manual Finite Element Analysis with Error Estimators : An Introduction to the FEM and Adaptive Error Analysis for Engineering Students (J. Akin)
Solution manual Basic Engineering Mathematics (4th Ed., John Bird)
Solution manual Engineering Mathematics (4th Ed., John Bird)
Solution manual Engineering Mathematics (5th Ed., John Bird)
Solution manual Higher Engineering Mathematics (5th Ed., John Bird)
Solution manual Construction Mathematics (Virdi & Baker)
Solution manual Mathematics for Electrical Engineering and Computing (Mary Attenborough)
Solution manual Probability and Random Processes : With Applications to Signal Processing and Communications (Miller & Childers)
Solution manual Introductory Statistics for Engineering Experimentation (Peter Nelson, Karen Copeland & Marie Coffin)
Solution manual Understanding Engineering Mathematics (Bill Cox)
Solution manual Statistics And Probability For Engineering Applications With Microsoft Excel (Decoursey)
Solution manual Business Math Using Calculators : With 10-Key Computer Assisted Instruction (Burton)
Solution manual Mathematics for Economics and Business (5th Ed., Ian Jacques)
Solution manual Business Math, Brief (7th Ed., Cleaves & Hobbs)
Solution manual Math for Merchandising: A Step-by-Step Approach (3rd Ed., Moore)
Solution manual Mathematics for Business (7th Ed., Salzman , Miller & Clendenen)
Solution manual Mathematics for Business (8th Ed., Salzman , Miller & Clendenen)
Solution manual Basic College Mathematics with Early Integers (K. Elayn Martin-Gay)
Solution manual Developmental Mathematics (K. Elayn Martin-Gay)
Solution manual An Introduction to Analysis (3rd Ed., William Wade)
Solution manual An Introduction to Analysis (4th Ed., William Wade)
Solution manual A Friendly Introduction to Analysis (2nd Ed., Witold A.J. Kosmala)
Solution manual Advanced Calculus (Gerald Folland)
Solution manual Analysis : With an Introduction to Proof (4th Ed., Steven R. Lay)
Solution manual Essentials of Basic College Mathematics (John Jr Tobey, Jr., Jeffrey Slater)
Solution manual Basic College Mathematics (5th Ed., John Tobey & Jeffrey Slater)
Solution manual Prealgebra (3rd Ed., Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Elementary Algebra Early Graphing for College Students

(3rd Ed., Allen Angel)
Solution manual Elementary Algebra (Michael Sullivan III, Katherine R. Struve & Janet Mazzarella)
Solution manual Elementary Algebra for College Students (7th Ed., Allen R. Angel)
Solution manual Experiencing Introductory and Intermediate Algebra Through Functions and Graphs (3rd Ed., JoAnne Thomasson & Robert Pesut)
Solution manual Introductory Algebra (3rd Ed., K. Elayn Martin-Gay)
Solution manual Beginning Algebra (6th Ed., John Jr Tobey & Jeffrey Slater)
Solution manual Beginning Algebra : Early Graphing (Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Beginning and Intermediate Algebra (2nd Ed., Jamie Blair, John Tobey & Jeffrey Slater)
Solution manual Introductory Algebra (4th Ed., Robert Blitzer)
Solution manual Introductory and Intermediate Algebra (2nd Ed., Robert Blitzer)
Solution manual Intermediate Algebra for College Students (7th Ed., Allen Angel)
Solution manual Intermediate Algebra (Michael Sullivan III & Katherine Struve)
Solution manual Intermediate Algebra (3rd Ed., K. Elayn Martin-Gay)
Solution manual Essentials of Intermediate Algebra for College Students (Robert Blitzer)
Solution manual Intermediate Algebra (4th Ed., Robert Blitzer)
Solution manual Intermediate Algebra for College Students (5th Ed., Robert Blitzer)
Solution manual Algebra A Combined Approach (3rd Ed., K. Elayn Martin-Gay)
Solution manual Elementary & Intermediate Algebra (Michael Sullivan III, Katherine R. Struve & Janet Mazzarella)
Solution manual Essentials of Introductory and Intermediate Algebra for College Students (Robert F. Blitzer)
Solution manual Algebra for College Students (3rd Ed., Allen R. Angel)
Solution manual Algebra for College Students (5th Ed., Robert F Blitzer)
Solution manual College Algebra (8th Ed., Michael Sullivan)
Solution manual College Algebra Essentials (8th Ed., Michael Sullivan)
Solution manual College Algebra (4th Ed., Robert Blitzer)
Solution manual College Algebra Essentials (2nd Ed., Robert F. Blitzer)
Solution manual College Algebra : An Early Functions Approach (Robert F. Blitzer)
Solution manual College Algebra : Concepts Through Functions (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual College Algebra : Concepts Through Functions (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual College Algebra Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Essentials of College Algebra : Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Algebra and Trigonometry (8th Ed., Michael Sullivan)

Solution manual Algebra and Trigonometry (3rd Ed., Robert F. Blitzer)
Solution manual Algebra and Trigonometry: An Early Functions Approach (Robert Blitzer)
Solution manual Algebra & Trigonometry (7th Ed., Michael Sullivan)
Solution manual Algebra and Trigonometry Enhanced With Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Trigonometry (7th Ed., Michael Sullivan)
Solution manual Trigonometry (8th Ed., Michael Sullivan)
Solution manual Trigonometry Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus (8th Ed., Michael Sullivan)
Solution manual Precalculus (3rd Ed., Robert Blitzer)
Solution manual Precalculus (4th Ed., Robert Blitzer)
Solution manual Precalculus (1st Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual Precalculus : A Right Triangle Approach (2nd Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual Precalculus Essentials (2nd Ed., Robert Blitzer)
Solution manual Precalculus Essentials (3rd Ed., Robert Blitzer)
Solution manual Precalculus : Concepts Through Functions, A Unit Circle Approach to Trigonometry (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Unit Circle Approach to Trigonometry (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Right Triangle Approach to Trigonometry (1st Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus : Concepts Through Functions, A Right Triangle Approach to Trigonometry (2nd Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Enhanced with Graphing Utilities (5th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Precalculus Essentials : Enhanced with Graphing Utilities (4th Ed., Michael Sullivan III & Michael Sullivan)
Solution manual Excursions in Modern Mathematics (5th Ed., Peter Tannenbaum)
Solution manual Excursions In Modern Mathematics with Mini-Excursions (6th Ed., Peter Tannenbaum)
Solution manual Quantitive Reasoning & the Environment (Greg Langkamp & Joseph Hull)
Solution manual Fundamentals of Mathematics (10th Ed., William M Setek & Michael A Gallo)
Solution manual Learning Math in Elementary and Middle School & IMAP Package (4th Ed., Cathcart, Pothier, Vance & Bezuk)
Solution manual Understanding the Math You Teach: Content and Methods for Prekindergarten Through Grade 4 (Anita C. Burris)
Solution manual Algebra Connections (Ira J. Papick & UMO University of Missouri)
Solution manual Calculus Connections (Asma Harcharras, Dorina Mitrea)
Solution manual Data Analysis and Probability Connections: Mathematics

for Middle School Teachers (Debra A. Perkowski & Michael Perkowski)
Solution manual Geometry Connections (John K. Beem)
Solution manual Elementary Math Modeling Updated (2nd Ed., Mary Ellen Davis & C. Henry Edwards)
Solution manual Additional Calculus Topics (11th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Finite Math and Its Application (9th Ed., Larry J Goldstein, David I Schneider & Martha J. Siegel)
Solution manual Finite Mathematics and Its Application (10th Ed., Larry J Goldstein, David I Schneider & Martha J. Siegel)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and social Sciences (11th Ed., Haeussler, Paul & R.J. Wood)
Solution manual Introductory Mathematical Analysis for Business, Economics and the Life and Social Sciences (12th Ed., Haeussler, Paul & R.J. Wood)
Solution manual Additional Calculus Topics (9th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual College Mathematics for Business, Economics, Life Sciences and Social Sciences (10th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Brief Calculus and Its Applications (11th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Brief Calculus and Its Applications (12th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus and its Applications (10th Ed., Larry Goldstein, David Schneider, David Lay)
Solution manual Calculus and its Applications (11th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus and its Applications (12th Ed., Larry Goldstein, David Schneider, David Lay & Nakhle Asmar)
Solution manual Calculus for Business, Economics, Life Sciences and Social Sciences (10th Ed., Raymond Barnett, Michael Ziegler & Karl Byleen)
Solution manual Calculus, Early Transcendentals (6th Ed., C. Henry Edwards & David Penney)
Solution manual Calculus, Early Transcendentals (7th Ed., C. Henry Edwards & David Penney)
Solution manual Calculus (9th Ed., Dale Varberg, Edwin Purcell & Steve Rigdon)
Solution manual Calculus Early Transcendentals (Dale Varberg, Edwin Purcell & Steve Rigdon)
Solution manual Calculus (3rd Ed., Monty Strauss, Gerald Bradley & Karl Smith)
Solution manual Calculus (6th Ed., Henry Edwards & David E. Penney)
Solution manual Single Variable Calculus (3rd Ed., Monty Strauss, Gerald Bradley & Karl Smith)
Solution manual Vector Calculus (3rd Ed., Susan Colley)
Solution manual Applied Linear Algebra (Peter Olver & Cheri Shakiban)
Solution manual Differential Equations and Linear Algebra (2nd Ed., Jerry Farlow, James E. Hall, Jean Marie McDill & Beverly West)
Solution manual Differential Equations and Linear Algebra (2nd Ed., C. Henry Edwards & David Penney)

Solution manual Differential Equations and Linear Algebra (3rd Ed., C. Henry Edwards & David Penney)
Solution manual Differential Equations (2nd Ed., John Polking, Al Boggess & David Arnold)
Solution manual Differential Equations with Boundary Value Problems (2nd ed., John Polking, Al Boggess & David Arnold)
Solution manual Discrete Mathematics with Graph Theory (3rd Ed., Edgar Goodaire & Michael Parmenter)
Solution manual Essential Discrete Mathematics (Todd Feil & Joan Krone)
Solution manual Statistical Methods for the Social Sciences (4th Ed., Agresti & Finlay)
Solution manual A Brief Course in Mathematical Statistics (Tanis & Hogg)
Solution manual Business Mathematics, 10th Ed. (Miller, Salzman & Clendenen)
Solution manual Elementary Statistics (6th Ed., Weiss)
Solution manual Elementary Statistics (7th Ed., Weiss)
Solution manual Elementary Statistics (8th Ed., Weiss)
Solution manual Elementary Statistics Using the Graphing Calculator: For the TI-83/84 Plus (Mario Triola)
Solution manual Elementary Statistics Using the TI-83/84 Plus Calculator (2nd Ed., Mario Triola)
Solution manual Elementary Statistics Using the TI-83/84 Plus Calculator (3rd Ed., Mario Triola)
Solution manual Elementary Statistics Update (9th Ed., Mario Triola)
Solution manual Elementary Statistics (10th Ed., Mario Triola)
Solution manual Elementary Statistics (11th Ed., Mario Triola)
Solution manual Elementary Statistics - Technology Update (11th Ed., Mario Triola)
Solution manual Essentials of Statistics (2nd Ed., Mario Triola)
Solution manual Essentials of Statistics (3rd Ed., Mario Triola)
Solution manual Essentials of Statistics (4th Ed., Mario Triola)
Solution manual Introductory Statistics (7th Ed., Neil Weiss)
Solution manual Introductory Statistics (8th Ed., Neil Weiss)
Solution manual Introductory Statistics (9th Ed., Neil Weiss)
Solution manual Intro Stats (2nd Ed., De Veaux, Velleman & Bock)
Solution manual Intro Stats (3rd Ed., De Veaux, Velleman & Bock)
Solution manual Stats: Data and Models, (De Veaux, Velleman & Bock)
Solution manual Stats: Data and Models, (2nd Ed., De Veaux, Velleman & Bock)
Solution manual Elementary Statistics Using Excel (2nd Ed., Mario Triola)
Solution manual Elementary Statistics Using Excel (3rd Ed., Mario Triola)
Solution manual Elementary Statistics Using Excel (4th Ed., Mario Triola)
Solution manual Stats : Modeling the World (2nd Ed., Bock, Velleman & De Veaux)
Solution manual Stats : Modeling the World (3rd Ed., Bock, Velleman & De Veaux)
Solution manual Statistical Reasoning for Everyday Life (2nd Ed., Bennett, Briggs & Triola)

Solution manual Statistical Reasoning for Everyday Life (3rd Ed., Bennett, Briggs & Triola)
Solution manual Business Statistics (Triola & Franklin)
Solution manual Business Statistics (1st Ed., Sharpe, De Veaux & Velleman)
Solution manual Business Statistics (2nd Ed., Sharpe, De Veaux & Velleman)
Solution manual Business Statistics : A First Course (Sharpe, De Veaux & Velleman)
Solution manual Biostatistics for the Biological and Health Sciences with Statdisk (Marc Triola & Mario Triola)
Solution manual Biostatistics : A Guide to Design, Analysis and Discovery (2nd Ed., Ronald Forthofer, Eun Lee, Mike Hernandez)
Solution manual A Course in Probability (Neil A. Weiss)
Solution manual Probability and Statistics (3rd Ed., DeGroot & Schervish)
Solution manual Probability and Statistics (4th Ed., DeGroot & Schervish)
Solution manual Statistics for Science and Engineering (John Kinney)
Solution manual Mathematical Proofs : A Transition to Advanced Mathematics (1st Ed., Chartrand, Polimeni & Zhang)
Solution manual Mathematical Proofs : A Transition to Advanced Mathematics (2nd Ed., Chartrand, Polimeni & Zhang)
Solution manual Elementary Number Theory (5th Ed., Kenneth H. Rosen)
Solution manual History of Mathematics : Brief Version (Victor J. Katz)
Solution manual Geometry : An Investigative Approach (2nd Ed., Phares G. O'Daffer & Stanley Clemens)
Solution manual A First Course in Abstract Algebra (7th Ed., John Fraleigh)
Solution manual Complex Variables with Applications (3rd Ed., David Wunsch)
Solution manual Numerical Analysis with CD-ROM (Timothy Sauer)
Solution manual Numerical Analysis and Scientific Computation (Jeffery Leader)
Solution manual Linear Algebra and Differential Equations (Gary Peterson & James Sochacki)
Solution manual Elementary Differential Equations (2nd Ed., Werner Kohler & Lee Johnson)
Solution manual Elementary Differential Equations with Boundary Value Problems (2nd Ed., Werner Kohler & Lee Johnson)
Solution manual Fundamentals of Differential Equations (6th Ed., Kent B. Nagle, Late, Edward B. Saff & Arthur David Snider)
Solution manual Fundamentals of Differential Equations and Boundary Value Problems (4th Ed., Kent B. Nagle, Late, Edward B. Saff & Arthur David Snider)
Solution manual Linear Algebra and Its Applications with CD-ROM, Update (3rd Ed., David C. Lay)
Solution manual Introduction to Linear Algebra (5th ed., Lee W. Johnson, R. Dean Riess & Jimmy T. Arnold)
Solution manual Calculus for the Life Sciences (Marvin L. Bittinger, Neal Brand & John Quintanilla)
Solution manual Calculus with Applications for the Life Sciences

(Raymond N. Greenwell, Nathan P. Ritchey & Margaret L. Lial)
Solution manual Calculus : An Integrated Approach to Functions and Their Rates of Change, Preliminary Edition (Robin J. Gottlieb)
Solution manual Calculus (9th Ed., George B. Thomas, Jr. & Ross L. Finney)
Solution manual Thomas' Calculus, Alternate Edition (9th Ed., George B. Thomas, Jr. & Ross L. Finney)
Solution manual Calculus : A Complete Course (2nd Ed., Ross L. Finney, Franklin D. Demana, Bert K. Waits & Daniel Kennedy)
Solution manual Calculus (Elgin H. Johnston & Jerry Mathews)
Solution manual Thomas' Calculus, Updated (10th Ed., George B. Thomas, Jr., Ross L. Finney, Maurice D. Weir & Frank R. Giordano)
Solution manual Thomas' Calculus (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual Thomas' Calculus Early Transcendentals (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual University Calculus (Joel D. Hass, Maurice D. Weir & George B. Thomas, Jr.)
Solution manual University Calculus : Alternate Edition (Joel D. Hass, Maurice D. Weir & George B. Thomas, Jr.)
Solution manual Thomas' Calculus, Media Upgrade (11th Ed., George B. Thomas, Jr., Maurice D. Weir & Frank R. Giordano)
Solution manual Thomas' Calculus, Early Transcendentals, Media Upgrade (11th Ed., George B. Thomas, Jr., Maurice D. Weir, Joel D. Hass & Frank R. Giordano)
Solution manual Calculus with Applications (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Calculus with Applications, Brief Version (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Finite Mathematics with Applications (9th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Finite Mathematics with Applications (10th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Finite Mathematics (8th Ed., Margaret L. Lial, Raymond N. Greenwell & Nathan P. Ritchey)
Solution manual Mathematics with Applications (9th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Mathematics with Applications (10th Ed., Margaret L. Lial, Thomas W. Hungerford & John Holcomb)
Solution manual Mathematical Ideas (10th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas (11th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas Expanded Edition (10th Ed., Miller, Heeren & Hornsby)
Solution manual Mathematical Ideas Expanded Edition (11th Ed., Miller, Heeren & Hornsby)
Solution manual Using and Understanding Mathematics: A Quantitative Reasoning Approach (3rd Ed., Bennett & Briggs)
Solution manual Using and Understanding Mathematics: A Quantitative Reasoning Approach (4th Ed., Bennett & Briggs)
Solution manual A Problem Solving Approach to Mathematics (9th Ed.,

Billstein, Libeskind & Lott)
Solution manual A Survey of Mathematics with Applications (7th Ed., Angel, Abbott & Runde)
Solution manual A Survey of Mathematics with Applications: Expanded Edition (7th Ed., Angel, Abbott & Runde)
Solution manual Mathematics All Around (3rd Ed., Tom Pirnot)
Solution manual Mathematics for Elementary School Teachers (3rd Ed., Phares O'Daffer, Randall Charles, Thomas Cooney, John Dossey & Jane Schielack)
Solution manual Mathematics for Elementary School Teachers (4th Ed., Phares O'Daffer, Randall Charles, Thomas Cooney, John Dossey & Jane Schielack)
Solution manual Mathematics for Elementary Teachers with Activities (Sybilla Beckmann)
Solution manual Mathematics for Elementary Teachers plus Activities Manual (2nd Ed., Sybilla Beckmann)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (8th Ed., Billstein, Libeskind & Lott)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (9th Ed., Billstein, Libeskind & Lott)
Solution manual A Problem Solving Approach to Mathematics for Elementary School Teachers (10th Ed., Billstein, Libeskind & Lott)
Solution manual Essentials of Using and Understanding Mathematics : A Quantitative Reasoning Approach (Jeffrey Bennett & William Briggs)
Solution manual Technical Calculus with Analytic Geometry (4th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics (8th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics (9th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus (8th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus (9th Ed., Allyn Washington)
Solution manual Basic Technical Mathematics with Calculus Metric Version (8th Ed., Allyn Washington)
Solution manual Introduction to Technical Mathematics (5th Ed., Washington, Triola & Reda)
Solution manual A Graphical Approach to Precalculus (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits (3rd Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits : A Unit Circle Approach (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Precalculus with Limits : A Unit Circle Approach (5th Ed., Hornsby, Lial & Rockswold)
Solution manual Precalculus : Functions and Graphs (5th Ed., Demana, Waits, Foley & Kennedy)
Solution manual Precalculus : Graphical, Numerical, Algebraic (7th Ed., Demana, Waits, Foley & Kennedy)
Solution manual Precalculus : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Precalculus : Graphs and Models Graphing Calculator

Manual Package (4th Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Functioning in the Real World : A Precalculus Experience (2nd Ed., Gordon, F. Gordon, Tucker & Siegel)
Solution manual Precalculus with Modeling and Visualization (3rd Ed., Gary K. Rockswold)
Solution manual Precalculus with Modeling and Visualization (4th Ed., Gary K. Rockswold)
Solution manual Precalculus (2nd Ed., Beecher, Penna & Bittinger)
Solution manual Precalculus (3rd Ed., Beecher, Penna & Bittinger)
Solution manual Precalculus (3rd Ed., Mark Dugopolski)
Solution manual Precalculus (4th Ed., Mark Dugopolski)
Solution manual Precalculus : Functions and Graphs (2nd Ed., Mark Dugopolski)
Solution manual Precalculus : Functions and Graphs (3rd Ed., Mark Dugopolski)
Solution manual Fundamentals of Precalculus (Mark Dugopolski)
Solution manual Trigonometry (1st Ed., Mark Dugopolski)
Solution manual Trigonometry (2nd Ed., Mark Dugopolski)
Solution manual Trigonometry (3rd Ed., Mark Dugopolski)
Solution manual Trigonometry (8th Ed., Lial, Hornsby & Schneider)
Solution manual Trigonometry (9th Ed., Lial, Hornsby & Schneider)
Solution manual Trigonometry : A Circular Function Approach (Marie Aratari)
Solution manual A Graphical Approach to Algebra and Trigonometry (4th Ed., Hornsby, Lial & Rockswold)
Solution manual A Graphical Approach to Algebra and Trigonometry (5th Ed., Hornsby, Lial & Rockswold)
Solution manual Algebra and Trigonometry : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual Algebra and Trigonometry (2nd Ed., Beecher, Penna & Bittinger)
Solution manual Algebra and Trigonometry (3rd Ed., Beecher, Penna & Bittinger)
Solution manual College Algebra and Trigonometry (1st Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra and Trigonometry (2nd Ed., J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra and Trigonometry (3rd Ed., Mark Dugopolski)
Solution manual College Algebra and Trigonometry (4th Ed., Mark Dugopolski)
Solution manual College Algebra and Trigonometry : A Unit Circle Approach (5th Ed., Mark Dugopolski)
Solution manual Algebra and Trigonometry with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual Algebra and Trigonometry with Modeling and Visualization (4th Ed., Gary Rockswold)
Solution manual College Algebra and Trigonometry (3rd Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra and Trigonometry (4th Ed., Lial, Hornsby & Schneider)
Solution manual A Graphical Approach to College Algebra (4th Ed., John

Hornsby, Margaret Lial & Gary Rockswold)
Solution manual A Graphical Approach to College Algebra (5th Ed., John Hornsby, Margaret Lial & Gary Rockswold)
Solution manual College Algebra : Graphs and Models Graphing Calculator Manual Package (3rd Ed., Bittinger, Beecher, Ellenbogen & Penna)
Solution manual College Algebra (J. S. Ratti & Marcus S. McWaters)
Solution manual College Algebra with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual College Algebra with Modeling and Visualization (4th Ed., Gary Rockswold)
Solution manual Essentials of College Algebra with Modeling and Visualization (3rd Ed., Gary Rockswold)
Solution manual Essentials of College Algebra (Lial, Hornsby & Schneider)
Solution manual Essentials of College Algebra, Alternate Edition (Lial, Hornsby & Schneider)
Solution manual Essentials of College Algebra (10th Ed., Lial, Hornsby & Schneider)
Solution manual College Algebra (3rd Ed., Mark Dugopolski)
Solution manual College Algebra (4th Ed., Mark Dugopolski)
Solution manual College Algebra (5th Ed., Mark Dugopolski)
Solution manual College Algebra in Context with Applications for the Managerial, Life, and Social Sciences (1st Ed., Ronald Harshbarger & Lisa Yocco)
Solution manual College Algebra in Context with Applications for the Managerial, Life, and Social Sciences (2nd Ed., Ronald Harshbarger & Lisa Yocco)
Solution manual College Algebra (2nd Ed., Judith Beecher, Judith Penna & Marvin Bittinger)
Solution manual College Algebra (9th Ed., Margaret Lial, John Hornsby & David Schneider)
Solution manual Essentials of Geometry for College Students (2nd Ed., Margaret Lial, Barbara Brown, Arnold Steffenson & L. Murphy Johnson)
Solution manual Algebra for College Students (5th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (2nd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (3rd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory and Intermediate Algebra (4th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning and Intermediate Algebra (3rd Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning and Intermediate Algebra (4th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Elementary and Intermediate Algebra (1st Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Elementary and Intermediate Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Introductory and Intermediate Algebra : A Combined Approach (2nd Ed., Marvin Bittinger & Judith Beecher)
Solution manual Introductory and Intermediate Algebra (3rd Ed., Marvin

Bittinger & Judith Beecher)
Solution manual Introductory and Intermediate Algebra through Applications (2nd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Elementary and Intermediate Algebra (1st Ed., George Woodbury)
Solution manual Elementary and Intermediate Algebra (2nd Ed., George Woodbury)
Solution manual Elementary and Intermediate Algebra (2nd Ed., Mark Dugopolski)
Solution manual Elementary and Intermediate Algebra (3rd Ed., Mark Dugopolski)
Solution manual Elementary and Intermediate Algebra : Concepts and Applications (4th Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Beginning and Intermediate Algebra with Applications and Visualization (Gary Rockswold & Terry Krieger)
Solution manual Elementary and Intermediate Algebra : Graphs & Models (2nd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Foundations of Mathematics (Marvin Bittinger & Judith Penna)
Solution manual Intermediate Algebra (9th Ed., Marvin Bittinger)
Solution manual Intermediate Algebra (10th Ed., Marvin Bittinger)
Solution manual Intermediate Algebra : Graphs & Models (2nd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Intermediate Algebra : Graphs & Models (3rd Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Intermediate Algebra (8th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Intermediate Algebra (9th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Intermediate Algebra with Applications and Visualization (2nd Ed., Gary Rockswold & Terry Krieger)
Solution manual Intermediate Algebra (Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Intermediate Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Intermediate Algebra: Concepts and Applications (7th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Beginning Algebra (10th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Prealgebra and Introductory Algebra (Marvin Bittinger & David Ellenbogen)
Solution manual Prealgebra and Introductory Algebra (2nd Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Elementary Algebra (2nd Ed., Tom Carson, Ellyn Gillespie & Bill Jordan)
Solution manual Introductory Algebra (9th Ed., Marvin Bittinger)
Solution manual Introductory Algebra (10th Ed., Marvin Bittinger)
Solution manual Prealgebra and Introductory Algebra (2nd Ed., Margaret Lial, John Hornsby, Terry McGinnis & Diana Hestwood)
Solution manual Prealgebra and Introductory Algebra (3rd Ed., Margaret Lial, Diana Hestwood, John Hornsby & Terry McGinnis)
Solution manual Elementary Algebra with Early Systems of Equations

(Tom Carson & Ellyn Gillespie)
Solution manual Elementary Algebra : Concepts and Applications (6th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Elementary Algebra : Concepts and Applications (7th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Introductory Algebra (Richelle Blair)
Solution manual Introductory Algebra (8th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Introductory Algebra (9th Ed., Margaret Lial, John Hornsby & Terry McGinnis)
Solution manual Beginning Algebra with Applications and Visualization (Gary Rockswold & Terry Krieger)
Solution manual Integrated Arithmetic and Basic Algebra (3rd Ed., Bill Jordan & William Palow)
Solution manual Introductory Algebra through Applications (Geoffrey Akst & Sadie Bragg)
Solution manual Prealgebra (3rd Ed., Margaret Lial & Diana Hestwood)
Solution manual Prealgebra (4th Ed., Margaret Lial & Diana Hestwood)
Solution manual Prealgebra (4th Ed., Marvin Bittinger & David Ellenbogen)
Solution manual Prealgebra (5th Ed., Marvin Bittinger, David Ellenbogen & Barbara Johnson)
Solution manual Prealgebra (2nd Ed., Tom Carson)
Solution manual Basic Mathematics (9th Ed., Marvin Bittinger)
Solution manual Basic Mathematics (10th Ed., Marvin Bittinger)
Solution manual Basic Mathematics Preliminary Edition (Robert Prior)
Solution manual Basic Mathematics with Early Integers (Marvin Bittinger & Judith Penna)
Solution manual Basic College Mathematics (7th Ed., Margaret Lial, Stanley Salzman & Diana Hestwood)
Solution manual Basic College Mathematics (8th Ed., Margaret Lial, Stanley Salzman & Diana Hestwood)
Solution manual Basic Mathematics through Applications (3rd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Fundamental Mathematics through Applications (3rd Ed., Geoffrey Akst & Sadie Bragg)
Solution manual Wave Motion (J. Billingham & A. C. King)
Solution manual Solving ODEs with MATLAB (L. F. Shampine, I. Gladwell & S. Thompson)
Solution manual Numerical Solution of Partial Differential Equations: An Introduction (2nd Ed., K. W. Morton & D. F. Mayers)
Solution manual Measure Theory and Filtering : Introduction and Applications (Lakhdar Aggoun & Robert J. Elliott)
Solution manual Mathematical Models in Biology : An Introduction (Elizabeth S. Allman & John A. Rhodes)
Solution manual Insurance Risk and Ruin (David C. M. Dickson)
Solution manual Data Analysis and Graphics Using R : An Example-based Approach (2nd Ed., John Maindonald & John Braun)
Solution manual Applied Optimization with MATLAB Programming (1st Ed., P. Venkataraman)
Solution manual Applied Optimization with MATLAB Programming (2nd Ed., P. Venkataraman)
Solution manual Convex Optimization (Stephen Boyd & Lieven

```
Vandenberghe)
Solution manual Concrete Abstract Algebra : From Numbers to Gr=F6bner
Bases (Niels Lauritzen)
Solution manual A Concrete Approach to Abstract Algebra : From the
Integers to the Insolvability of the Quintic (Jeffrey Bergen)
Solution manual Calculus : Concepts and Methods (Ken Binmore & Joan
Davies)
Solution manual An Introduction to Partial Differential Equations
(Yehuda Pinchover & Jacob Rubinstein)
Solution manual An Introduction to Ordinary Differential Equations
(James C. Robinson)
Solution manual An Introduction to Mathematical Physiology and Biology
(2nd Ed., J. Mazumdar)
Solution manual An Introduction to Financial Option Valuation :
Mathematics, Stochastics and Computation (Desmond Higham)
Solution manual An Interactive Introduction to Mathematical Analysis
(Jonathan Lewin)
Solution manual An Introduction to Mathematical Finance: Options and
Other Topics (1st Ed., Sheldon M. Ross)

List of Solutions Manuals and Test Banks
----

contact me to : mattosbw1@gmail.com
mattosbw1(at)gmail.com

NOTE : "THIS SERVICE IS NOT AVAILABLE FOR : CHINA, INDIA, RUSSIA, PAKISTAN, IRAQ, IRAN, PHILIPPINES, NORTH KOREA, NEPAL, BANGLADESH, SRI LANKA, MALDIVES, BHUTAN & COLOMBIA".

If your wanted solutions manual is not in this list, also can ask me if is available (it is a partial list). Then if you need solutions manual only contact me by email.

"ARE NOT AVAILABLES BOOKS IN DIGITAL FORMAT", ONLY SOLUTIONS MANUALS AND TEST BANKS.

This same "list of titles" of texts with availables solutions manual and/or test banks is for download from :

http://www.megaupload.com/?d=3DADDS77XH

I do not review the forums, just send me an email.

- Physics & Astronomy :

Solution manual Introduction to Solid State Physics (8th Ed., Charles Kittel)
Solution manual Quantum Physics (3rd Ed., Stephen Gasiorowicz)
Solution manual Fundamentals of Nuclear Reactor Physics (Elmer Lewis)
Solution manual Nuclear Energy : An Introduction to the Concepts, Systems, and Applications of Nuclear Processes (6th Ed., Raymond L. Murray)
Solution manual Fundamentals of Electromagnetics with Engineering Applications (Stuart M. Wentworth)
Solution manual Physics (7th Ed. by Paul E. Tippens)
Solution manual Physics (6th Ed., Cutnell & Johnson)
Solution manual Physics (7th Ed., Cutnell & Johnson)
Solution manual Physics (8th Ed., Cutnell & Johnson)
Solution manual Essentials of Physics (Cutnell & Johnson)
Solution manual Understanding Physics (1st Ed., Cummings, Laws, Redish & Cooney)
Solution manual Introductory Physics : Building Understanding (Jerold Touger)
Solution manual Physics Matters : An Introduction to Conceptual Physics (James Trefil & Robert Hazen)
Solution manual How Things Work : The Physics of Everyday Life (3rd Ed., Louis Bloomfield)
Solution manual An Introduction to Modern Astrophysics (2nd Ed., Bradley W. Carroll & Dale A. Ostlie)
Solution manual Foundations of Astrophysics (Barbara Ryden & Bradley Peterson)
Solution manual Physics (5th Ed., Halliday, Resnick, Krane)
Solution manual Fundamentals of Physics (6th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (7th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (8th Ed., David Halliday, Robert Resnick & Jearl Walker)
Solution manual Fundamentals of Physics (9th Ed., David Halliday,

Robert Resnick & Jearl Walker)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (3rd Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (4th Ed., Thomas Griffith)
Solution manual The Physics of Everyday Phenomena : A Conceptual Introduction to Physics (5th Ed., Thomas Griffith)
Solution manual Physics of Everyday Phenomena : A Conceptual Introduction to Physics (6th Ed., W. Thomas Griffith & Juliet W. Brosing)
Solution manual Integrated Science (2nd Ed., Tillery et al.)
Solution manual Integrated Science (3rd Ed., Tillery et al.)
Solution manual Integrated Science (4th Ed., Tillery et al.)
Solution manual Physical Science (5th Ed., Tillery)
Solution manual Physical Science (6th Ed., Tillery)
Solution manual Physical Science (7th Ed., Tillery)
Solution manual Physical Science (8th Ed., Tillery)
Solution manual The Physical Universe (11th Ed., Konrad Krauskopf & Arthur Beiser)
Solution manual The Physical Universe (12th Ed., Konrad Krauskopf & Arthur Beiser)
Solution manual Physics of the Life Sciences (Jay Newman)
Solution manual Physics in Biology and Medicine (3rd Ed., Paul Davidovits)
Solution manual Optics (1st Ed., Ajoy Ghatak)
Solution manual Optics (4th Ed., Eugene Hecht)
Solution manual Nonlinear Optics (3rd Ed., Robert Boyd)
Solution manual Introduction to Optics (3rd Ed., Frank L Pedrotti, Leno M Pedrotti & Leno S Pedrotti)
Solution manual Principles of Physical Optics (Charles Bennett)
Solution manual Optics : Principles and Applications (Kailash Sharma)
Solution manual Continuum Electromechanics (James R. Melcher)
Solution manual Electromagnetic Noise and Quantum Optical Measurements (Hermann A. Haus)
Solution manual Matter and Interactions I : Modern Mechanics (2nd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions : Volume 1 : Modern Mechanics (3rd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions II : Electric and Magnetic Interactions (2nd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Matter and Interactions : Volume 2 : Electric and Magnetic Interactions (3rd Ed., Ruth W. Chabay & Bruce A. Sherwood)
Solution manual Thermal Stresses (2nd Ed., Noda, Hetnarski & Tanigawa)
Solution manual Introduction to Statistical Physics (Kerson Huang)
Solution manual Extended Irreversible Thermodynamics (3rd Ed., D. Jou, J. Casas-Vazquez & G. Lebon)
Solution manual An Introduction to Thermodynamics and Statistical Mechanics (2nd Ed, Keith Stowe)
Solution manual Equilibrium and Non-Equilibrium Statistical Thermodynamics (Michel Le Bellac, Fabrice Mortessagne & G. George Batrouni)
Solution manual Elements of Statistical Mechanics: With an Introduction to Quantum Field Theory and Numerical Simulation (Ivo

Sachs & Siddhartha Sen)
Solution manual Quantum Transport (2nd Ed., Supriyo Datta)
Solution manual Ocean Waves and Oscillating Systems (Johannes Falnes)
Solution manual Statistical Mechanics (2nd Ed., R.K. Pathria)
Solution manual Quantum Mechanics (Gennaro Auletta, Mauro Fortunato & Giorgio Parisi)
Solution manual Applied Quantum Mechanics (1st Ed., A. F. J. Levi)
Solution manual Applied Quantum Mechanics (2nd Ed., A. F. J. Levi)
Solution manual Fundamentals of Quantum Mechanics (C.L. Tang)
Solution manual Astronomy : A Physical Perspective (2nd Ed., Marc L. Kutner)
Solution manual Classical Mechanics (Douglas Gregory)
Solution manual Electromagnetic Field Theory Fundamentals (2nd Ed., Singh Guru & Hiziroglu)
Solution manual Special Relativity : From Einstein to Strings (P.M. Schwarz & J.H. Schwarz)
Solution manual Gravity : An Introduction to Einstein's General Relativity (James Hartle)
Solution manual A Short Course in General Relativity (3rd Ed., James Foster & J. David Nightingale)
Solution manual Statistical Thermodynamics (Normand Laurendeau)
Solution manual Statistical Thermodynamics and Microscale Thermophysics (Van P. Carey)
Solution manual Thermal Physics (Ralph Baierlein)
Solution manual Topics in Atomic Physics (Charles E. Burkhardt, Jacob J. Leventhal)
Solution manual Foundations of Quantum Physics (Charles E. Burkhardt, Jacob J. Leventhal)
Solution manual Applied Physics (8th Ed., Dale Ewen, Ronald Nelson, Neill Schurter & Erik Gundersen)
Solution manual Applied Physics (9th Ed., Dale Ewen, Neill Schurter & Erik Gundersen)
Solution manual Analytical Mechanics (7th Ed., Grant R. Fowles, George Cassiday)
Solution manual Orbital Mechanics for Engineering Students (1st Ed., Howard Curtis)
Solution manual Orbital Mechanics for Engineering Students (2nd Ed., Howard Curtis)
Solution manual Diagnostic Ultrasound Imaging : Inside Out (Thomas Szabo)
Solution manual Astronomy : A Beginner's Guide to the Universe (5th Ed., Eric Chaisson & Steve McMillan)
Solution manual The Cosmic Perspective (5th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Cosmic Perspective Media Update (4th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective Media Update (4th Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective Media Update (3rd Ed., Jeffrey O. Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual The Essential Cosmic Perspective (3rd Ed., Jeffrey O.

Bennett, Megan Donahue, Nicholas Schneider & Mark Voit)
Solution manual Astronomy Today (5th Ed., Eric Chaisson & Steve McMillan)
Solution manual Astronomy Today (6th Ed., Eric Chaisson & Steve McMillan)
Solution manual Conceptual Physical Science (3rd Ed., Paul G. Hewitt, John A. Suchocki & Leslie Hewitt)
Solution manual Conceptual Physical Science (4th Ed., Paul G. Hewitt, John A. Suchocki & Leslie Hewitt)
Solution manual Conceptual Integrated Science (Paul G. Hewitt, Suzanne Lyons, John A. Suchocki & Jennifer Yeh)
Solution manual Physics : Concepts & Connections (4th Ed., Art Hobson)
Solution manual Physics : Concepts & Connections (5th Ed., Art Hobson)
Solution manual Conceptual Physics (10th Ed., Paul Hewitt)
Solution manual Conceptual Physics (11th Ed., Paul Hewitt)
Solution manual Conceptual Physics Fundamentals (Paul G. Hewitt)
Solution manual College Physics (6th Ed., Jerry Wilson, Anthony Buffa & Bo Lou)
Solution manual College Physics (7th Ed., Jerry Wilson, Anthony Buffa & Bo Lou)
Solution manual College Physics (8th Ed., Young & Geller)
Solution manual Modern Physics (2nd Ed., Randy Harris)
Solution manual Modern Physics for Scientists and Engineers (John Morrison)
Solution manual Solid State Physics : Essential Concepts (David Snoke)
Solution manual Physics with Mastering Physics (3rd Ed., James Walker)
Solution manual Physics with Mastering Physics (4th Ed., James Walker)
Solution manual Active Learning Guide (Alan Van Heuvelen & Eugenia Etkina)
Solution manual E&M TIPERs : Electricity & Magnetism Tasks (C. J. Hieggelke, D. P. Maloney, T. L. O'Kuma & Steve Kanim)
Solution manual Physics : Principles with Applications (6th Ed., Douglas C. Giancoli)
Solution manual Physlet=AE Physics : Interactive Illustrations, Explorations and Problems for Introductory Physics (Wolfgang Christian & Mario Belloni)
Solution manual University Physics with Modern Physics with Mastering Physics (11th Ed., Hugh Young & Roger Freedman)
Solution manual University Physics with Modern Physics with Mastering Physics (12th Ed., Hugh Young & Roger Freedman)
Solution manual Physics for Scientists and Engineers (3rd Ed., Douglas C. Giancoli)
Solution manual Physics for Scientists and Engineers with Modern Physics (3rd Ed., Douglas Giancoli)
Solution manual Physics for Scientists and Engineers with Modern Physics (4th Ed., Douglas Giancoli)
Solution manual Physlet=AE Quantum Physics : An Interactive Introduction (Mario Belloni, Wolfgang Christian & Anne Cox)
Solution manual Introduction to Electrodynamics (3rd Ed., David J. Griffiths)
Solution manual Introduction to Quantum Mechanics (2nd Ed., David Griffiths)
Solution manual Quantum Mechanics : An Accessible Introduction (Robert

Scherrer)
Solution manual Modern Quantum Mechanics (J. J. Sakurai)
Solution manual The Physics of Sound (3rd Ed., Richard Berg & David Stork)
Solution manual Electromagnetism : Principles and Applications (1st Ed., Paul Lorrain, Dale R. Corson)
Solution manual Classical Electromagnetism (Jerrold Franklin)
Solution manual Classical Electrodynamics (2nd Ed., John David Jackson)
Solution manual Nanoengineering of Structural, Functional and Smart Materials (Mark Schulz, Ajit Kelkar, Mannur Sundaresan)
Solution manual Introduction to Color Imaging Science (Hsien-Che Lee)
Solution manual An Introduction to Astrobiology (Iain Gilmour & Mark Sephton)
Solution manual An Introduction to Galaxies and Cosmology (Mark HJones & Robert Lambourne)
Solution manual An Introduction to the Solar System (Neil McBride & Iain Gilmour)
Solution manual Quantum Physics (Michel Le Bellac)
Solution manual Laser Fundamentals (2nd Ed., William T. Silfvast)
Solution manual Laser Electronics (3rd Ed., Joseph T. Verdeyen)
Solution manual Introductory Quantum Optics (Christopher Gerry & Peter Knight)
Solution manual Introduction to Plasma Physics: With Space and Laboratory Applications (D. A. Gurnett & A. Bhattacharjee)
Solution manual A Short Introduction to Quantum Information and Quantum Computation (Michel Le Bellac)
Solution manual A Quantum Approach to Condensed Matter Physics (Philip L. Taylor & Olle Heinonen)
Solution manual A First Course in String Theory (Barton Zwiebach)
Solution manual A First Course in Computational Physics and Object-Oriented Programming with C++ (David Yevick)
Solution manual A Course in Modern Mathematical Physics : Groups, Hilbert Space and Differential Geometry (Peter Szekeres)
Solution manual Ultrasonic Nondestructive Evaluation Systems: Models and Measurements (Lester W. Schmerr & Sung-Jin Song)
Solution manual Explorations : Stars Galaxies and Planets (1st Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (2nd Ed., Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (3rd Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (4th Ed. Updated, Thomas Arny)
Solution manual Explorations : An Introduction to Astronomy (5th Ed. Updated, Thomas Arny)
Solution manual Astronomy : Journey to the Cosmic Frontier (3rd Ed., John D. Fix)
Solution manual Astronomy : Journey to the Cosmic Frontier (4th Ed., John D. Fix)
Solution manual Astronomy : Journey to the Cosmic Frontier (5th Ed., John D. Fix)
Solution manual Pathways to Astronomy with Starry Night Pro (Steven

Schneider & Thomas T Arny)
Solution manual From Molecules to Networks (2nd Ed., John Byrne &
James Roberts)
Solution manual Biotechnology (David Clark & Nanette Pazdernik)
Solution manual Light and Video Microscopy (Randy Wayne)

It would just be a guess on their part. Like one said, it will depend mostly on the height in wavelength for the band being used at the time.

The easiest way to get a good guess would be to d/l one of the modeling programs and model a 3 el yagi for each of the bands. That will get you close enough for gov work. The type of yagi being modeled doesn't really matter, so there is no real need to exactly duplicate a A3S.. Just one of the regular included yagi models will do..

The speed of light is media dependent.
```

The media may or may not have characteristics that are frequency dependent.

Cart - Horse.

I think the difference might be in gain, not directivity...
The IR losses in the conductors (and components) would be different in a helically loaded monopole and a lumped network matching a short unloaded monopole. One could probably construct examples for cases where either one has lower loss.

There might also be a difference in the losses in the ground plane, although, intuitively, I suspect they would be small. The current distribution just isn't that different between the two cases

It would be interesting to run some cases where you use "wire" (1cm
diameter conductors on your helix are pretty big... I'd try something
like 1mm (18 AWG) or maybe 2mm (12 AWG)..

As I recall, NEC does figure out the losses accounting for skin effect,
etc., although it might not deal with the "proximity effect" from
adjacent turns.

Xref: g2news1.google.com rec.radio.amateur.antenna:20900

I built a so called "Super J-pole" which is really two stacked
collinear half
wave antennas with a quarter wave phasing stub between them. The
design is by
N7QVC and it can be seen at <http://www.n7qvc.com/amateur_radio/
copper.html>. I
also placed a photograph of a representative build in the photo
section of this
reflector at
<http://groups.yahoo.com/group/amateur_radio/photos/album/1449680574/
pic/3362107\
0/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc>.

I have had good results with this antenna but I wanted to make it into a dual band antenna that would work on seventy centimeters as well as on two meters. I was wondering if I could use a technique developed by Edison Fong, WB6IQN on this antenna in the same way he used it on an ordinary single half wave J-pole. What he did is to place an open quarter wave stub at the top of the two half wave lengths for seventy centimeters. That stub limits the UHF signal to the two half waves length at UHF of the antenna. It seems like it would work from having read his paper on the combination two meter and seventy centimeter J-pole antenna. That would give the antenna the same gain on seventy centimeters as a J-pole that is just for that band. For reference I have placed WB6IQNs paper in the files section of the newsgroup at
<http://f1.grp.yahoofs.com/v1/
kL6QTZLk1DQjM_Cn3vuvnsLUIuEsvRHSqUZyX2mw294a7mYKkc\
FBIXXlRY_6QxreqNWVpn0b7Dogiw9LafU63W429yoO/DBJ2_port_art.pdf>.

My first question is does anyone see any reason why this would not work?

My second question is how would I construct the stub into a copper J-pole. Since WB6IQNs J-pole is a wire antenna, with or without a plastic radome, he used a piece of Coaxial cable as part of his two meter wire with the shield at the end of the seventy centimeter portion of the antenna shorted to the two meter radiator and the bottom of the shield, which is a quarter wave at UHF below the top of the UHF segment, open relative to the two meter radiator. Could I just use a full quarter wave stub made from a copper T, a street L, and a short length of copper pipe turned back down along the two meter radiator? (A street L is a ninety degree bend formed to allow it to be close coupled to an adjacent fitting without a pipe nipple in between.)

My third question is if instead of shortening the lower VHF half wave electrically to a UHF length I found a way to short out the quarter wave phasing stub between the two VHF half wave radiators to UHF signals thus

giving UHF
signals three full wave lengths of radiator to use would the gain be
worth the
effort. To provide the shunting of the VHF quarter wave phasing stub I
was
GUESSING that a half wave UHF coupling stub might work.

I freely admit to being out of my depth; or as a mariner might say off
my
soundings; here. So I'm fully prepared to hear that the UHF half wave
coupling
stub would not work as a shunt for the UHF signals to get past the VHF
quarter
wave phasing stub. I have no pretense to any expertise. I'm trying to
learn.
Laugh all you want but if it won't work please tell me in neophyte
decipherable
language why not. If you have any guidance to offer it would be most
welcome
but please keep the fog index down to the degree you are able. Thank
you in
advance.

Depends what you mean by "space".. perfect vacuum, sure..

But what's between the planets in the Solar System isn't a perfect
vacuum, and so, it shows dispersion due to the presence of small amounts
of ionization.

Granted, it's generally a better vacuum than you are likely to achieve
on Earth by mechanical means.

Hi. Most of my ' Office Professional 2010 Serial' (http://www.office2010-key.eu/) have laptops with ' Office 2010 Professional X64' (http://www.office2010-key.eu/). They say its great and that it is much ' Microsoft Office 2010 Pro' (http://www.office2010-key.eu/) than Windows Vista and ' Office 2010 Pro Product Key' (http://www.office2010-key.eu/). I would like to change from Windows XP to Windows 7. Does the chang ' Office 2010 64bit' (http://www.office2010-key.eu/) the information and the programs found in the computer? I nee your help please!!

Speed of waves in a dispersive medium is temperature dependent.
In the Solar System the temperatures are decreasing with the distance from
the Sun.

You have send us: http://ipnpr.jpl.nasa.gov/progress_report/42-65/65I.PDF

It seems to me that the no answer for Maxwell's question:
"Incidentally, Maxwell once suggested that Roemer's method could be used to
test for the isotropy of light speed, i.e., to test whether the speed of
light is the same in all directions. Roemer's method can be regarded as a
means of measuring the speed of light in the direction from Jupiter to the
Earth. Jupiter has an orbital period of about 12 years, so if we use
Roemer's method to evaluate the speed of light several times over a 12 year
period, we will be evaluating the speed in all possible directions (in the
plane of the ecliptic). "

Do you know the answer?
S*

Here are the base feedpoint impedances for that NEC model
of a helix for the suggested conductor diameters...

 1mm =  0.12 -j 2260 ohms
 2mm =  0.12 -j 2170 ohms

Only for moon bounce.

For one antenna direct to another, they must both be the same. That would be RHC for both antennas or LHC for both antennas. If one is LHC and the other is RHC, there is about a 20 or so db difference, just as it would be going horizontal to vertical. If the signal bounces off something ONE time, then it is reversed.

There are other things that may cause the signal to be reversed or atleast be stronger if reversed. There are cases where the OSCAR signal will be stronger if the opposite sense is used. Sometimes while using a circular antenna (KLM22C) I have found earth station that use horizontal or vertical antennas stronger one way than the other.

Somehow, I think there is a difference. I think that they are being
shown to be the same in the computer model is not valid in the real
world. That said, in real world use, the differences do seem to be
insignificant.

And, that said, I use a helical wound, half-wave electrical length -
quarter-wave physical length, monopole in lieu of a 1/4 wave
physical-length and physical length antenna. And, in personal
experience, this DOES provide increased performance over the 1/4 wave.

In most real world restrictions, the helical wound versions always are
an advantage in real world physical size ...

Hello Dave,

If you have a directional antenna (take a Yagi) and you look to the back of the antenna (so you look in the direction of wave propagation), the E-veld vector moves in the same plane as the plane of the antenna.

When you take two of this antenna's, one vertical and one horizontal and feed them 90 degr out of time phase (same power to each antenna), the E-field vector will rotate when it passes a fixed reference plane. Depending on + or =96 90degr phase difference, the vector will rotate clockwise (RHC) or counter-clockwise (LHC).

Now take two of these circular antennas (for example both RHC). Now make one of the antennas the receive antenna. To do this, you have to rotate the antenna around its vertical axis over 180 degr. (so they look towards each other).   This flips the horizontal yagi (causing 180 degrees phase shift in the horizontal path), but the vertical yagi does not flip.

This 180 degrees phase shift in the horizontal path is the reason that total phase shift for both vertical pol. as well as horizontal pol. paths are in phase.

So for line of sight, and you use circular polarized antennas, you need two antennas with same sense. In case of a single reflection on a perfect conductor, you need to change the sense of one of the antennas. The reason for that is that the horizontal part of the circular antenna isn't flipped and both hor. and vert. polarized reflections experience 180 degr. phase shift.

For non-perfect materials: when the angle of incidence is far below the (pseudo) Brewster angle, you need antennas with opposite sense. When far above the Brewster angle (so small grazing angle), the antennas should have same sense for best results (if you want to use the reflection path).

At the (pseudo) Brewster angle, you lose most of the vertical polarized component (parallel polarized component in physics) when the media interface is in the horizontal plane. So the receive antenna sees a mostly linear polarized (horizontal) component. In practice this component may interfere with the direct path.

Unlike the original example, that would produce a quite different
current distribution on the antenna. I suspect the half-wave helical
wouldn't require as good a radial system as the standard 1/4WL
monopole since the current maximum point is halfway up the helical.
Did you end-feed the beast or center-feed it? Did you have a good
radial system?

Maybe.. depends on the medium, I should think, and the mechanism of the
dispersion.  Some dispersion might be due to ionization (which may or
may not be temperature dependent).

> In the Solar System the temperatures are decreasing with the distance from
> the Sun.
>

Temperature in a vacuum and with ionized particles is tricky to define.
It has to do with mean free path and the velocity of the particles.
When the number density gets down in the "few atoms per cubic meter" and
the mean free path gets to be meters or km, I think you need to start
thinking in different ways.

One common confusion is an assumption of a particular velocity
distribution in charged particles and then using the 11000K = 1 eV relation.

---------------

Quoting from Antenna Engineering Handbook, 2nd Edition by Johnson and Jasik, page 13-18: "For a normal-mode helix whose dimensions are small compared to a wavelength, the current distribution along the helix is approximately sinusoidal."

John Kraus also assumed sinusoidal current distribution along the helix in his Fig 8-72 (see clip).

This current sinusoid exists along the aperture of the helix, and not along the spiral conductor itself. Therefore it is unclear as to the source of this belief that current would be maximum at the center of "1/2-WL" helix whose end-end length is 1/4-WL. In reality the current maximum would be at the base of the radiator, just as it is for a 1/4-wave linear monopole.

The current distribution along the aperture of both of these forms of radiators has a sinusoidal shape. The current at the top of both of these radiators must be zero. The portion of a sinusoidal waveform at the operating frequency, beginning with zero current at the top, that can exist along the aperture of radiators that are physically short in terms of wavelength, as in my NEC comparison, appears to be a straight line with zero current at the top and maximum current at the base of the radiator.

With essentially identical current distribution along the aperture of both radiator forms, it should be expected that the helix and linear monopoles in this discussion should have essentially identical radiation resistances and patterns.

This has been shown to be true in the NEC comparison in the OP, and is supported by the quoted statements from well-respected authors of antenna engineering textbooks.

Yes. This is shown in various editions of the ARRL Antenna Handbook and
the ARRL Handbook itself.

The next step would be to run it plugging in some reasonable number for
the wire resistivity. The patterns should be quite similar. I theorize
that it will show that for same power in at the feedpoint, the "gain"
will be slightly less for the helically loaded one (because there's a
longer wire, so more resistance, for essentially the same current
distribution in the wire).

Then, the question would be whether the helically loaded unit has a
lower loss in a matching network at the base.

Correct.

Amazing how many smart people don't get it. Often the "dumb" people are much smarter.

>please keep the fog index down to the degree you are able

Hi Tom,

After looking at the mile long URL to one of your offerings - I would like to see the fog lift too.

Why don't you simply tell us what performance you want to achieve from an antenna?

A simple quarterwave antenna built on a SO-239 connector with four drooping radials is squat simple, cheap, and can be built and trimmed to near perfect match in half an hour or less. You want multiband? Make two vertical, slightly skewed elements (each cut for the suited band) joined at the feedpoint. You want more gain? How much more? Build two or (n-times) more and spend your effort in learning to construct feedline systems to additively join them.

Yes, but axial mode produces linear polarization, and that is not what
the question is about

It is known that the speed of light in air is temperature dependent ( mirage
and E. Schmidt's method in Fluid dynamics).
in vacuum also. But I culd find the results.

May be, but at first I must know if the mirage works in vacuum.
>

Yes. But the simple measurement of the mirage or E. Schmidt's effect in
vacuum will clarify everything.
"I am sure that such experiments were done". Could you help?

There is one product called "' Office Professional Plus 2010 32 Bit'
(http://www.office2010-key.eu/)," and another one called "' Office Home
And Student 2010 Serial' (http://www.office2010-key.eu/)" the price
difference is ' Office 2010 Professional 32 Bit'
(http://www.office2010-key.eu/) dollars the home ' Office Home And
Student 2010 Activation' (http://www.office2010-key.eu/) one being
cheaper. I just want to buy ' Microsoft Office 2010 X86 Key'
(http://www.office2010-key.eu/) for a new hard drive which one do i have
to buy?

How do you know that since the mode was not specified? On other
newsgroups, I have read about people worrying about RH or LH for
normal mode helical configurations.

But John, a helix that is 180 degrees long electrically is not small.
It is electrically double the size of a 1/4WL monopole.

Not true. Any monopole that is electrically 180 degrees long will have
the current maximum point in the middle and a normal mode helix is no
exception. You can easily model such with EZNEC. For any 180 degree
antenna, at the feedpoint, the reflected voltage will arrive in phase
with the forward voltage. The reflected current will arrive 180
degrees out of phase with the forward current.

Zfp =3D (Vfor+Vref)/(Ifor-Iref) is a current minimum

Take your NEC helical model and adjust the frequency to approximately
double the resonant frequency and take a look at the current
distribution.

I have already done an illustration based on the currents in the NEC comparison posted earlier, showing a helix and a linear monopole each about 6 degrees in aperture (link below).

This link shows that even though the length of wire used in the helix is 3.14 X the length used in the linear monopole, the current distribution along their apertures essentially is the same, as will be the directivity and radiation pattern of both versions.

This same equivalence would apply to the current distribution, directivity and pattern of a linear, 1/4-WL monopole and a helically-wound monopole that was 1/4-WL in aperture, but contained 1/2-WL of coiled wire.

"small" in Kraus's book means "physically" small, not electrically small.

This is no different than taking the "non-helical" antenna and feeding it at twice the frequency.

I would imagine that the pattern of the helically loaded and the
unloaded will be quite similar at ANY frequency, until you get to where
the *diameter* of the assembly starts to be a significant fraction of a
wavelength.

What might change more is the resistive losses, although I suspect
they'll scale in proportion too. Whether you've strung 10 meters, 20
meters or 30 meters of wire in a physical 10 meter length doesn't change
the *radiation* properties a huge amount.

How about Ordinary and Extraordinary rays in the dispersive medium of the ionosphere. Is the ionosphere "vacuum" enough for you? The space station orbits in the middle of it, and most folks think that qualifies as vacuum (1e-6 Torr, or so). Electron density runs pretty high: about 1E10-1E12/m3

At the top, the pressure runs about 1E-5 Pascal (7.5E-8 torr) & mean free path is on the order of tens of km.

There's lots and lots and lots of data about dispersion of EM propagation in the ionosphere.

Again, I'm not sure "temperature" is the relevant measure for something like that. You can define temperature for a very low pressure gas like this, but it's not in the same sort of sense as one would apply to a bulk tangible medium (like air at the Earth's surface or water)

Richard
I wanted to explore whether it is practical to have my collinear dual
```

half wave J-pole serve as a dual band antenna. If it were practical I would want the same gain on seventy centimeters that I have been getting out of the dual stacked half wave on two meters. The available testing that I was able to find says that it is 6 DB over a quarter wave vertical. What I would happily settle for would be for it to have the same gain on seventy centimeters as the dual band simple J-pole I am using now. After talking to Rol Anders, K3RA; who was the instructor for my Extra theory class and is the present chairman of the Question Pool Committee of the National Council of Volunteer Examiner Coordinators (NCVEC); last night I am taking that later approach. That is the approach that I outlined in the first paragraph of just putting an open blocking stub for UHF at thirty five centimeters ~ up the lower two meter half wave and therefore below the two meter phasing stub between the two meter half wave segments. That has the virtue of being simple and still giving me a dual band antenna that has better gain on UHF then the unmodified two meter antenna would.

I wanted a dual band antenna because I only have three suitable mounting points on my home and I already have plans for a six meter J-pole and an anemometer / sensor array assembly on the other two. I have an Arrow dual band J-pole up on that mounting point right now but I wanted to return to the higher gain of the collinear dual half wave J-pole that gave me so much better real world performance on two meters. It is my hope that just adding the seventy centimeter band blocking stub to the collinear antenna's lower two meter half wave segment will do the trick.

Isaac Asimov touched on this in his book on physics. He said the
temperature up there is high because of the high molecule velocity, but
that *heat* is another matter. So, you can have a high "temperature"
even if the "heat" is practically nil.

That makes you correct. One must carefully state what is meant by
temperature and what is meant by heat.

What we have here is a failure to communicate. Please forget about
your previous posting. We are not talking about 6 deg. electrically
short helicals. We are talking about comparing an 180 degree
electrically long monopole to a 90 degree long RESONANT monopole.
Here's how to accomplish what we are talking about:

1. Wind a helical that is 90 degrees long, i.e. the feedpoint
impedance is R1+j0. That helical is 1/4WL long electrically and
resonant. It may be ~1/8WL (45 deg) long physically.
2. Now increase the frequency until the helical is 180 degrees long
electrically. At something like double the frequency, it will be 1/2WL
long electrically and the feedpoint impedance will be R2+j0 where
R2>>R1. It may be ~1/4WL long physically.

John said his 180 degree helical outperformed his resonant 90 degree
helical. His statement has nothing to do with electrically short
helical monopoles because they are resonant.

The current maximum for a 90 degree resonant helical will be at the
base feedpoint just as it is for a 90 degree stub. The current maximum
for a 180 degree helical will be halfway up the antenna just as it is
halfway up a 180 degree stub.

A helical longer than a few degrees will exhibit transmission line effects. A helical that is electrically 180 degrees long will have essentially the same standing wave current envelope as a 180 degree long open-circuit transmission line stub. EZNEC agrees.

John said his 180 degree electrically long helical outperformed his electrically long 90 degree helical. The standing-wave current envelope for the 90 degree helical is a cosine with the current maximum at the feedpoint. The standing-wave current envelope for the 180 degree long helical is a sine wave with the current maximum point in the middle of the helical. They would not have the same radiation patterns. EZNEC agrees.

Again, I have modeled these conditions using EZNEC and I am reporting the results. The "Currents" button will give the current magnitude/ phase for each segment in the helical.

That is true ONLY if the end-to-end length (height) of a normal-mode helical monopole occupies about 180 degrees of a free-space wavelength.

If that helix occupies only about 90 degrees of a free-space wavelength, then no matter how much linear wire length is contained in the coils of the helix, that helical radiator will have the radiation resistance, pattern and directivity characteristics of a 90-degree linear monopole of the same end-to-end height.

The length of coiled wire in a helix of any physical length makes very little difference in the current distribution along its aperture, its directivity, or its radiation patterns.

Rather than suggesting that my previous posting(s) on this subject should be forgotten, perhaps they should be re-read -- especially the link to http://i62.photobucket.com/albums/h85/rfry-100/Monopole_Current.gif .

>quarter wave vertical. What I would happily settle for would be for
>it to have the same gain on seventy centimeters as the dual band
>simple J-pole I am using now.

Hi Tom,

It is extremely hard to accept claims for J-Poles when nothing is said about the care in choking the feed point, and further choking the section of line a quarter wave away from the feed point.

Typically this discussion is arrived at with some surprise on the part of the J-Pole user who posts here (I know you have participated here before, and are thus not a newbie). Some (which means too many) respond that choking is unnecessary. They are satisfied with its performance (never daring to examine that it could be vastly improved).

We also have writers here who condemn the J-Pole vehemently in equal measure. They, too, have not examined the necessity of choking and they suffer from the knowledge that things could be vastly improved.

This is the pitiable lament of feeding halfwave elements in any form.

Let's examine what you call "available testing." I presume this means in software, and not in the lab (never mind alternatives such as out in a field). I could be wrong and you may correct this on your response.

However, moving on with whatever presumption, the reason why choking is important is that with High Z antennas, they tend to drive the transmission line into radiation. This extends the length of the radiator, and too often this raises the lobe of maximum radiation up into the sky (you are very near that with the half wave where 5/8ths is considered the limit of physical height before this trips over).

These are all issues related to a vertical, and its elevation goes into the mix too to further confuse comparisons.

Now, basically you are asking the same antenna to operate at roughly triple the frequency. This also means either element of the native radiator will stand like something under 3/2 wavelengths tall - truly a cloud burner (not good).

You speak of stubs to fix this. You would have to start with two 3/2 halfwave radiators, one over the other. Fixing the phase for both 2M and 440 would be a miracle in achievement. I presume you would also trap the individual 3/2 wave length sections into two 5/8ths (but the ratios don't quite work out that way); or three half waves; or six quarter waves - and then do it again for the section above. Whew!

This is a monumental task - but you have simpler goals as the
following would suggest:

>just putting an open blocking stub for UHF at thirty five
>centimeters ~ up the lower two meter half wave and therefore below the
>two meter phasing stub between the two meter half wave segments. That
>has the virtue of being simple and still giving me a dual band antenna
>that has better gain on UHF then the unmodified two meter antenna
>would.

The blocking stub I presume you to mean a trap for 440. It is going
to upset the matching stub between the two halfwave 2M elements. Here
you will have to juggle between tuning them both on each band.

It is less than monumental, but still quite a job, and one that
demands that you cut and try and fully erecting your last attempt to
see how it works (doing this on the ground is going to lead to grief -
especially if you ignore proper choking).

P.S.

Both linear, and helical normal-mode monopoles of ~6 degrees physical aperture (and less) can be made resonant at the operating frequency via a suitable inductance placed either in the monopole itself, or at its feedpoint.

But resonance so achieved does NOT mean that such monopole radiators will have a very useful amount of radiation resistance, or that such a resonant condition equates to the performance of a radiator that is resonant without the need for such an additional inductance.

This reality appears to have been overlooked in some of the earlier posts in this thread.

I suppose, too, that the whole things still works in terms of, say,
propagation velocity of sound, because that is driven by velocity of
molecules/atoms (and is related to square root of Temperature).

So, sound propagates very quickly in the ionosphere (it's got a fairly
high temperature), but because there's not a whole lot of atoms around,
the attenuation will be quite high (essentially infinite, I suspect)

And that's totally different than propagating something by EM waves.

I just modeled a 5.25' long helical using EZNEC at the 270 degree 3rd
harmonic frequency of 26.5 MHz. Both helical and whip are modeled as
lossless.

If I understand you correctly, the 270 degree helical should have a
TOA equal to a 5.25' whip. The TOAs differ by 6 degrees. The maximum
gain of the 5.25' whip is -0.25 dBi. The maximum gain of the 270
degree helical of the same length is +0.29 dBi, a difference of 0.54
dB.

The 5.25' whip is1/4WL resonant at 45.3 MHz with a maximum gain of
-0.25 dBi at a TOA of 27 degrees. The 5.25' helical at 45.3 MHz has a
gain of -3.13 dBi at a TOA of 24 degrees, a difference of 2.88 dBi and
3 degrees.

Faraday supposed that this apply to the electric waves. Of course there the electrons vibrate. The relation to temperature of electrons would be easy to measure.

No. Acoustic waves from the Sun (aurora) are et the Earth quite strong.

>
> And that's totally different than propagating something by EM waves.

Electric waves propagate in metal and in space. In the both media the electrons vibrate. "I suppose we may compare together the matter of the aether and ordinary matter (as, for instance, the copper of the wire through which the electricity is conducted), and consider them as alike in their essential constitution"(Faraday).

It would be easy after Schmidt's experiment in vacuum. There the hot cylider in air bends the light rays and the shadow diameter is bigger than for the cold cylinder.
The same experiment in vacuum tell us if speed of light is electrons temperature dependent.

A normal-mode helical with a radiating aperture of 5.25' is not a "270 degree" radiator on 26.5 MHz. It is a ~ 51 degree radiator on that frequency.

This is making no sense to me so I fear we have some sort of semantic problem. I'm now not sure what you mean by "a radiating aperture of 5.25 feet". "The IEEE Dictionary" says: "In some cases, the aperture may be considered to be a line." I was assuming that the 5.25 feet aperture was akin to a line of straight wire 5.25 feet long or a 5.25 foot long (end to end) helical monopole. If that is not the case, please enlighten me on your definition of "aperture". EZNEC says my 5.25' (end-to-end) physically tall helical monopole is electrically 270 degrees long.

I assumed that 5.25' is the length of a straight wire or the physical end-to-end length of the helix itself (not the linear length of the wire). The velocity factor of a helix is a function of the helix geometry and *varies widely with diameter and turn spacing*. The helix I designed using EZNEC has a current maximum at the feedpoint, a current minimum 1/3 of the distance up the helix, a current maximum 2/3 of the distance up the helix, and a current minimum at the end of the helix. That's 270 electrical degrees any way you cut it because *there is always 90 electrical degrees between the current maximum and current minimum in a standing wave*.

The requirement that a 5.25' tall helical monopole has to satisfy to be 270 electrical degrees long on 26.5 MHz is to have a velocity factor of 5.25/27.85 =3D 0.1885 which is a piece of cake. The 5.25' is the actual end-to-end height of the helical monopole and the 27.85' is 3/4 of a wavelength in free space at 26.5 MHz.

Note that the velocity factor is the distance a traveling wave travels in the helical medium in unit time compared to the distance a traveling wave travels in free space in the same unit time.

Richard, this is giving me a headache - what am I missing?

Sorry, I just noticed you are talking about physical length rather than electrical length. Do you agree that the helical is 270 degrees long *electrically* because there are two current maximum points and two current minimum points on the helical antenna that is 5.25 feet long?

```
FP-Imax-///////////////////-Imin-///////////////////-
Imax-///////////////////-Imin
```

The Imax points are 3.5 feet apart. They are not very far apart compared to wavelength (~0.1WL) but they are far enough apart to raise the take-off-angle by 6 degrees for my particular helical according to EZNEC. With everything else being equal, when a 5.25 foot helical antenna has more than one current maximum point on the antenna, it will raise the take-off-angle by an amount correlated to the percentage of a wavelength spacing between the two current maximum points.

Conclusion: What you have said seems to be a fact for antennas with only one current maximum. The presence of two (or more) current maximum points on the antenna modifies the take-off-angle according to the laws of radiation physics which is demonstrated by NEC using the method-of-moments algorithms. A 5.25' end-to-end helical is not the same as a "~51 degrees radiator on 26.5 MHz" when it has two (or more) current maximum points separated by, e.g. 0.1WL. The two take-off-angles are 20% different just as they should be.

I am using program that comes ' Microsoft Office 2010 Update Key' (http://www.office2010-key.co.uk/) and I am considering getting Windows 7. I have been shopping online and I have found ' Office Pro 2010 Product Key' (http://www.office-2010-key.de/) and Windows 7 Upgrade. When I think of an upgrade, I think of it as something to improve ' Office Pro Plus 2010 X64' (http://www.office2010-key.in/) I already have. Is this the case with ' Windows 7 Starter Key' (http://www.windows-7-key.in/)? Is it an improvement on Windows 7? If so, why hasn't the upgrade been integrated with the Windows 7 software?

If it were practical I would want the same gain on seventy centimeters that I have been getting out of the dual stacked half wave on two meters. The available testing that I was able to find says that it is 6 DB over a quarter wave vertical. What I would happily settle for would be for it to have the same gain on seventy centimeters as the dual band simple J-pole I am using now. After talking to Rol Anders, K3RA; who was the instructor for my Extra theory class and is the present chairman of the Question Pool Committee of the National Council of Volunteer Examiner Coordinators (NCVEC); last night I am taking that later approach. That is the approach that I outlined in the first paragraph of just putting an open blocking stub for UHF at thirty five centimeters ~ up the lower two meter half wave and therefore below the two meter phasing stub between the two meter half wave segments. That has the virtue of being simple and still giving me a dual band antenna that has better gain on UHF then the unmodified two meter antenna would.
>
> I wanted a dual band antenna because I only have three suitable mounting points on my home and I already have plans for a six meter J-pole and an anemometer / sensor array assembly on the other two. I have an Arrow dual band J-pole up on that mounting point right now but I wanted to return to the higher gain of the collinear dual half wave J-pole that gave me so much better real world performance on two meters. It is my hope that just adding the seventy centimeter band blocking stub to the collinear antenna's lower two meter half wave segment will do the trick.

http://www.arrowantenna.info/osj/j-pole.html

This design works moderately well. Drive the 19.25 inch element. The 51 inch element is the radiator on 2m, the 6.xx inch element makes the 19.25 inch one radiate on 440. The thing isn't great on 440 because the 51 inch portion is there. It is rugged though.

I built a duplicate, which you can do if you look at all the parts pages on the site. The main problem, same as all J poles, is common mode current issues on the feedline.

Sorry, missed the part where you already have this antenna. My fault
for not reading the whole post until after I responded.

Cecil -

The link below shows the NEC-2D results for the 3-m monopole whose geometry I posted earlier -- at its frequency of first self-resonance, and at 3X that frequency.

We don't disagree as far as current distribution is concerned, but maybe in the belief that such a helix at an operating frequency that is 3X its first resonance has a practical benefit for users.

The reason that it may not is traceable to the radiation resistances at each frequency w.r.t. a fixed amount of antenna system loss.

I'm not saying that it has a benefit - just that a 270 degree electrically long antenna can never have the same radiation pattern as a 51 degree physical whip even if the physical length of the 270 degree helical antenna is physically 51 degrees.

To be clear on what I am saying: Up to a certain percentage of a wavelength, the physical length of the antenna dictates the radiation pattern. Above that percentage of a wavelength, the theory falls apart.

It is akin to assuming that the current distribution in the top portion of a monopole is a straight line. At some point, the straight line assumption fails because the current distribution is actually sinusoidal.

Hi Tom,

Your suggestion would have been my choice too - except for Tom's first
purchase choice. The open stub has always seemed to be a more natural
feed method.

The addition of the parasitic radiator is still an option for any
design.

Posting-Frequency: posted monthly
URL: http://www.panix.com/~rram/usenet/rram/index.html

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. We are currently trying
this on a temporary basis (90 days, through early July 2009), and adopt
it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and

news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those that have been created consistent with the suggestions in "So You Want to Create an Alt Newsgroup" at:

  http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either "radio.amateur" or "ham-radio" in their names, including uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved newsgroups up-to-date. In case we have overlooked any, and a submission is rejected in error as a result, the rejected submitter can E-mail us at our administrative contact address (in the signature at the bottom of this article, and the default Reply-To for the rejection message) requesting that it be added, and that the article be approved. We may still choose to reject articles crossposted to any alt.* newsgroup with an inappropriate name, including obscene language, embedded name-calling, or encouragement of unlawful conduct.

Please direct any comments, questions, or criticisms to rec-radio-amateur-moderated-request@panix.com.

> Do you have an EZnec file you can post? I'd like to see what you're doing=
.

It is at:

http://www.w5dxp.com/helix.EZ

The 90 degree (1/4WL) resonant frequency is 10.067 MHz where the TOA
is 150 degrees.

The 270 degree (3/4WL) resonant frequency is 26.493 MHz where the TOA
is 155 degrees.

The difference in TOA is because of the two current maximum points at
26.493 MHz.

The 180 degree (1/2WL) resonant frequency is 16.6254 MHz where the TOA
is 29 degrees. Raising the single current maximum point from the
feedpoint to the midpoint of the helical monopole only moves it by
2.625 feet which is 0.0444WL (16 physical degrees) and that lowers the
TOA by one degree. Since the 1/2WL helical contains twice as much
wire as the 1/4WL helical, I don't see any advantage for the 1/2WL
helical over the 1/4WL helical except for the elevated current maximum
point which may require a less robust radial system.

The "Currents" button on EZNEC will display the current magnitude/
phase in the helical segments.

"acoustic waves" whatever you think they are do not propagate through a
vacuum. The aurora is NOT caused by acoustic waves.

>> And that's totally different than propagating something by EM waves.
>
> Electric waves propagate in metal and in space. In the both media the

But that is not how the waves propagate. In either material.

"I suppose we may compare together the matter of the

If you spent some time to understand the basic concepts, you might
realize just how wrong you are.

> S*
>
>

What is the point of all this? You refuse to try to understand the basic
concepts, yet want to dig into the more esoteric stuff.

I just modeled the 1/4WL helical vs the 1/2WL helical with 4 elevated
radials and copper wire losses. The 1/2WL helical gain is 1.23 dB
higher than the 1/4WL helical gain and the TOA is 2 degrees lower for
the 1/2WL version.

Hello Cecil, for me the radial / counterpoise issue is a big advantage
of electrically (near) half wave structures (think of JOTA). As we use
100W maximum, high voltage at the feed point isn't a breakpoint mostly
(I have some CW Tesla coil experience).

73, Wim, PA3DJS, www.tetech.nl.

```

> vacuum.

"The Earth is constantly immersed in the solar wind, a rarefied flow of hot plasma (gas of free electrons and positive ions) emitted by the Sun in all directions, a result of the two-million-degree heat of the Sun's outermost layer, the corona. The solar wind usually reaches Earth with a velocity around 400 km/s, density around 5 ions/cm3 and magnetic field intensity around 2-5 nT (nanoteslas; Earth's surface field is typically 30,000-50,000 nT). These are typical values. During magnetic storms, in particular, flows can be several times faster; the interplanetary magnetic field (IMF) may also be much stronger."

>The aurora is NOT caused by acoustic waves.

" In the explosive event that a coronal mass ejection (CME) is reported it's time to hop into action because this super-charged solar wind is traveling fast (maybe 3-to-5 million miles per hour). When this energy sweeps by the earth 1-to-3 nights later there is a very good chance of aurora activity".
From: http://aurorahunter.com/aurora-prediction.php

Do you think that ions and atoms in the solar wind do not vibrate?

The topic is: " It was known that different frequencies travel with
different speeds on a
long cable".

Is the same in air and space?"

The answers were YES.

What do you want to add?
S*

Sure... the number density of ionized particles is somewhat bigger than
the 5/cc you describe above, so solar wind is actually not a big
contributor to it. Most of the ionization comes from UV ionizing the
air atoms/molecules. (that's what the whole daytime sky wave off the F
layer is all about, after all.. working Australia from the California on
20 meters at 5AM CA time probably isn't a good bet)

> From: http://aurorahunter.com/aurora-prediction.php

That's not acoustic. That's just particles streaming out into space,
and because there's not many other particles to bump into, most of them
get to Earth

Good afternoon.
We are a group of volunteers who care about the fate of those who got
into trouble.
We urge all people to help the citizens of Japan. In the Czech Republic
we have organized a fundraising drive. They are very necessary for those
who remained without a roof over your head. Hope very much for your
help. One we can not cope with this tragedy. All the money will pass to
the Embassy of Japan.
Provide a report on the use of money.
Requisites for conversion to U.S. dollars:

Account name:
Sergey Timofeev
Account number:
600 617 50 01
Bank code:
5500
IBAN:
CZ77 5500 0000 0060 0617 5001
SWIFT/BIC:
RZBCCZPP
Bank address:
Raiffeisenbank, a.s.
Hvezdova 1716/2b
Prague
Czech Republic

Answer all questions. Write to timservlad@yahoo.com
Thank you all for your help.

```

In space is also the dust. The  ionized particles can come from them also.
The Moon is a big dust.

Cars produce the hot wind (exhaust pipe) with the acoustic waves. Is
possible to produce only streaming?
There must be the oscillatory flow.

you produce hot wind also...  you should learn to listen and get into
this century.  no, the solar wind is not oscillatory, it flows from
the sun all the way past pluto.  it also varies in speed quite a bit
so if the light was being propagated by the particles in the solar
wind we would see large changes in the velocity and intensity coming
from the sun that would be very easy to measure, and would likely have
killed off all life long ago.

<you produce hot wind also...

But also with nois.

< you should learn to listen and get into this century. no, the solar wind
is not oscillatory,

Yes. But if no the sunspost (explosions).

<it flows from the sun all the way past pluto. it also varies in speed
quite a bit
so if the light was being propagated by the particles in the solar
wind we would see large changes in the velocity and intensity coming
from the sun that would be very easy to measure

Good idea. Have you a procedure for such measurements. But the changes are
rather small.

<, and would likely have killed off all life long ago.

The changes makes auroras only.

Richard

I didn't ignore choking the feed line but I will readily confess that I did not choke it twice. Starting immediately below the bottom of the matching stub I followed the recommendation of the various authors and wound a multi-turn coax balun with a six inch diameter coils of coax. They call for ten turns if I recall correctly. I was not aware of the need for a second choke at one quarter wavelength away. Do you have the energy to explain why that is necessary? How critical is the length between the two chokes. Do I use the middle of the two chokes as my measuring points? Could I substitute a one to one current balun built of ferrite beads? That would have a less intrusive appearance and accumulate less ice in the winter.

If you check the link that I gave for Ed Fong's dual band j-pole; available here <http://f1.grp.yahoofs.com/v1/kL6QTZLk1DQjM_Cn3vuvnsLUIuEsvRHSqUZyX2mw294a7mYKkc\FBIXXlRY_6QxreqNWVpn0b7Dogiw9LafU63W429yoO/DBJ2_port_art.pdf> or just look it up in the files section of the Yahoo reflector; you will see that he did test it in the field with fairly sophisticated instrumentation. He uses a trapped radiator to obtain similar gain on seventy centimeters as a simple J-pole without the trap gets on two meters. His work was published in QST and I didn't find any authoritative repudiation, or even strong criticism, of his design.

Why would the presence of the trap in the lower half wave of the two meter collinear half wave J-pole wreck the tuning on two meters.

I'm only trying to learn here.

Currently my low-bands antenna consists of a sloping inverted vee. The center insulator is attached at the chimney support on the back of the house at about 27 feet above ground and is fed with open-wire line, which drops straight down into the basement shack. Each leg of the dipole is 75 feet long with 60 feet between the center insulator and a 12 foot 2x4 at the two fence corners. The last 15 feet of each leg then makes a 90 degree bend and is fastened to the fence top at five feet above ground.

The antenna in its current configuration seems to put out a good signal, about what one would expect for an antenna at this height. I have been thinking about adding a 40 foot self-supporting fiberglass pole at the center of the back yard fence. This would allow me to lengthen each leg by about 22 feet, and the two legs could be connected to an insulator mounted on the flagpole. In this configuration the ends of the legs would be elevated to an height of 40 feet. I could also remove the insulator, and by joining the two ends I would have a loop antenna with total length of about 194 feet.

Before expending money and time on this antenna modification, I would be interested in comments about what, if anything, I might expect in improved antenna performance.

At best, most any wire antenna for 80 meters below 100 feet or so is just a
crap shoot. The new configuration you want to use will probably work beter
in some directions and distances and worse in others.
If the pole did not cost too much, it may help if you can get the center of
the dipole up to 40 feet and the ends up some also.

Followup -- the link below compares the relative current distribution, directivity and radiation efficiency of a helical and a linear radiator system when the helical radiator described in my earlier post is operating at the frequency of its first self-resonance, and the linear monopole height is set for its first self-resonance at that same frequency.

It is interesting to note that linear form has better performance than the helical form.

Hi Tom,

This sound like very common advice - so common that it begs investigation because it is common advice for HF Choking, not 2M, and certainly not 70cm. However, this common advice acknowledges the need for choking.

You would be better served using ferrites (W2DU style BalUn/Choke), or, if you really wish to stick with wound coax, then use a Grid Dip Meter to test its resonance (which should reveal you can't serve both bands). Using an antenna analyzer to do this will give you measurable Z, and that may give you the data to see how well you are doing. You may wind a lot of chokes to discover that the diameter is extraordinarily huge (or so the same for turn count - one or the other or both).

>I was not aware
>of the need for a second choke at one quarter wavelength away. Do you
>have the energy to explain why that is necessary?

[Do I have the energy.... With all the junk cluttering this space outside of this thread, I have plenty of energy.]

The antenna fields will try to excite the transmission line's common mode (the shield of the coax that it sees). This will induce currents that will become radiative (just like stacked elements in a vertical multi-element radiator - sound familiar?). The use of chokes at quarterwave intervals snubs these currents.

Sometimes more chokes are needed. I use a 20' long line with a bead every four inches or so. The intent is to create a very long resistor (very wide bandwidth) with very short leads (very high frequency) between its distributed resistance.

>How critical is the
>length between the two chokes.

Not particularly, you would be well served to attempt to make it at the interval of quarterwave at the highest frequency used (70cm). This, then, would snub lower frequency (2M) common mode currents.

>Do I use the middle of the two chokes
>as my measuring points?

This sounds deceptively exact (and probably a consideration for those enormous chokes of common advice vintage). No, such exactitude is going to be lost at the 70cm scale anyway which will be perturbed by other factors (have I talked about environment?).

>Could I substitute a one to one current balun
>built of ferrite beads? That would have a less intrusive appearance
>and accumulate less ice in the winter.

I would prefer not to add yet one more account registration to simply view this, sorry. However, the narrative here should tell you if we agree.

>you will see
>that he did test it in the field with fairly sophisticated
>instrumentation. He uses a trapped radiator to obtain similar gain on
>seventy centimeters as a simple J-pole without the trap gets on two
>meters.

My background was working in the standards laboratory system of NBS (my speciality was RF measurement to the highest accuracies). I know that sophisticated instrumentation and quality results don't necessarily track each other. My point was about environment, not instrumentation anyway. You don't need $1000 meters, but you might need $1,000,000 environment.

The description of Apple's echoless environmental chamber used to test their iPod is a marvel of engineering, and cost a stack of dollars.

>His work was published in QST and I didn't find any
>authoritative repudiation, or even strong criticism, of his design.

The same could be said of publishing it in Playboy. QST needs content to offer subscribers. Vanity articles satisfy that need. Think of these articles as the introduction to a topic, not the final word.

>Why would the presence of the trap in the lower half wave of the two
>meter collinear half wave J-pole wreck the tuning on two meters.

The trap's tuning is heavily influenced by the geometry of the elements because they are also part of the tuning. The trap disturbs that symmetry. You have also introduced new L and C components that further upsets the total circuit. These things are not super-critical when you consider that moving a resonance (say) 145KHz out of 145MHz is only a shift of 0.1%. That isn't super-critical either.

Or maybe it is.

>I'm only trying to learn here.

Let me know if this helps.

Mr. Clark -

Your posts are occasionally informative, but usually not, as demonstrated here. You have not offered anything of technical substance in so many of your posts. It is obvious that you are knowledgeable in the subject, but you seem to have a problem communicating that knowledge. We could all benefit from your knowledge, but please do so with direct technical information rather than the example above.

Please,
John

Yes, I'm using a balanced tuner. The problem with 60 feet legs is that while it matches nicely on 80 meters, on 40 meters it becomes difficult to match, given my current feeder length. Adding the additional 15 feet to each leg ends up with a reasonably easy match on all bands (80 - 10 meters). In addition, I feed the antenna as a Marconi (inverted L configuration) on 160 meters, and the additional 15 feet on each leg again makes it easier to match.

Hello Richard Fry,

Why is this so interesting, as it is what I expect (and I think you
expect this also)? The current*(physical length) product is more, so
given same feed current it produces more field (hence more radiated
power). This results in higher input impedance, hence reducing the 10
ohms ground loss.

The small change in shape of pattern is just due to the less isotropic
array pattern of the 0.25 lambda radiator (w.r.t. to the array pattern
of the 3 m radiator).

If it is not time consuming, I would like to see what happens when you
extend the helix until it gets its second (half wave) high impedance
resonance (current maximum in the middle). I expect some gain increase
due to small change in antenna pattern and reduced ground loss.

=A1Very informative thread!

73, Wim, PA3DJS, www.tetech.nl.

Hi John,

Technical chaff is rarely useful information. I am pretty sure that was the point (but it is a rather Baroque discussion) Richard was trying to illustrate.

Simple observation will reveal how this thread has become about trying to get the camel through the eye of the needle: Richard's link points to data that reveals differences displayable (and arguably measureable) only out to 10% - that is pretty meager steam for heated rhetoric in this engine of discussion (it has been far more about purple prose than substance before I dipped my oar here).

Hello John,

I made (and still use) same type of wheatstone bridge refl. coeff.
meter with BAT15 diodes (so only low power) and 0805 SMD. Instead of a
moving coil indicator I used a 10 MOhm DVM (to get better linearity at

low power input).

Such a simple device is very useful. Only limitation is that you can't have it in between during normal operation as you have 6 dB insertion loss.

That's a great idea. I wish I had thought of that.

John

Hello John, Jimmie and others,

If the DC input resistance of the DVM is very large compared to the
zero bias differential resistance of the diode, there is a tight
relation between DC output voltage and the RF input voltage with
reasonable temperature behavior.

If you measure the RF to DC curve at about 5 RF input levels (at say
10 MHz, just with an oscilloscope and simple RF signal source), you
can make a curve fitted table/graph to handle the linear to quadratic
transition at around 150mV RF peak voltage. This enables you to
convert DC output to RF input voltage. You can expect about 1mV DC
from a real schottky diode for 10mVp RF input voltage (across the
diode junction).

Hi OM Chris,

Focus is on shunt feed wich gives the discharge path for the static.

This is not possible with the 1/4 wave since there is no matching coil.

Many thanks.

73

Nandu.

But you could put a 1 Meg resistor(or a RF choke, for that matter)
across the feed to discharge static with almost no effect on RF performance.

One of the other advantages of a 5/8 long radiator is that the pattern
is slightly "flatter"... it would show up on an antenna range or a
model, but on an actual vehicle, it might not make as much difference

Hi OM Jim,

I agree with you on all points.

For working mobile, an antenna radiating at higher angles is preferable since base station antennas would be at a height and repeater antennas even higher.

On the other hand, for the base station, a flatter antenna pattern would help while working mobile stations (e.g a Slim Jim would be better than a GP).

Maybe in the Los Angeles area close to the 5000 ft high mountains the
repeaters would be be high up, but I think for the vast majority of
cases, the vertical elevation angle to a repeater would be pretty low
(<10 degrees).

Consider a repeater on a 100 meter tower.   If you're more than 1 km
away, it's less than 6 degrees above the horizon. If you're within a
km, you're close enough you don't need the gain.

A few years ago there was some discussion on r.r.a.a. about helically-wound, normal-mode monopoles, and the rather common expectation that they had higher gain than a linear monopole of the same physical height (and with other things equal).

A recent NEC-2 analysis of this topic might be of interest:
http://i62.photobucket.com/albums/h85/rfry-100/Helix_vs_Linear_Monopole.gif
.

Also this link to a page from John Kraus' ANTENNAS FOR ALL APPLICATIONS, 3rd Edition: http://i62.photobucket.com/albums/h85/rfry-100/Helically-woundVertical.gif
.

"This finding had practical applications for telegraph communications. For example, Heaviside actually solved one of the biggest problems affecting long distance telegraph and telephone communication in 1887 -distortion. It was known that different frequencies travel with different speeds on a long cable. For example, the low bass frequencies in a voice signal travel faster than the high treble frequencies. When the cable is long enough, the frequencies smear, and both voice and telegraph signals become garbled noise. Heaviside used his equations to show that if inductances (i.e., a small coil of wire) were added along the length of the cable, the distortion could be reduced." From:

Hi OM Jim,

You're right. Guess I must have erred in my observations.

Helically-woundVertica...

Kraus' short resonant normal-mode helical antenna uses close to 1/4WL
of conductor. We know that because of adjacent turn coupling, when a
conductor is coiled into a helical configuration, more conductor is
required to maintain a constant electrical length, e.g. 90 degrees in
this case. I suspect that Kraus' helical antenna example would be
resonant at about 1.8 times the design frequency rather than at the
design frequency. Please note the last line in the Kraus quote
regarding the advantage of a helix.

Since a helical monopole is 90 degrees long at the design frequency,
one wonders if half of the helix would be 45 degrees long at the
design frequency? And if the missing half of the antenna were replaced
by a whip to return to the original resonant frequency, why wouldn't
we have a base loaded antenna with the base loading coil occupying 45
degrees?

Hello Richard,

Maybe there is confusion between gain and directivity.

When there is no change in the phase of the current, and overall physical length << 0.25 lambda, directivity will be 1.76 dBi (or 4.76 dB over perfect electrical conducting ground).

I can imagine that part of the matching can be in the helix (lots of copper) so that the ohmic loss may be less w.r.t. to a lumped coil at the feed point. If so, the gain of the helix can be higher.

If you can make the helix electrically longer then 0.25 lambda (so that current maximum is not in the feed point, but for example in the middle), directivity will not change, but ground loss will reduce as the helix will have high Re(Zin).

Hello Szczepan,

Search for the effective permittivity of media with free electrons
(plasma). You will see that the effective permittivity changes with
frequency, hence the phase velocity.  Don't look strange to find
apparent permittivities below the value for vacuum.

Just ignore DC magnetic field as this complicates that math
significantly.

I was always under the assumption that the helical whip was
less efficient than the same height whip loaded with a lumped coil.
I NEVER thought the helical whip had the advantage. And so far my
experience with the mobile whips seems to show that an efficient
lumped coil has the advantage.
>
> A recent NEC-2 analysis of this topic might be of interest:
> http://i62.photobucket.com/albums/h85/rfry-100/Helix_vs_Linear_Monopole.gif

Where is the coil on the linear monopole? Seems to be a flawed
example to me. The helical example is loaded, but the linear is not?
What kind of comparison would that be to jive with the real world?
Of course, most will find that the location of the lumped coil
on a whip will effect efficiency and current distribution.
IE: the center loaded whip will generally have an advantage over
a base loaded whip.

A helical loaded whip can be a decent antenna, but I've always
had better results using the lumped coil.
Also, a helical whip needs some capacitive loading "IE: decent
length whip above the helical windings" to live up to it's
expectations. The helical whips with windings all the way to
the top doesn't do so well.

Also, the manner in which a helical whip is wound will effect
current distribution. It's best to maximize the windings near
the top rather than use a constant pitch the whole whip.
Much in the same manner that a lumped coil whip usually does
better with a center or higher mounted coil vs a base load.

If a helical winding was as efficient as a lumped coil, I
would not have converted my helical wound whips to lumped
coils. And if this were true, I would not have noticed any

difference when I did. But I did notice a difference.
So I think I will stick with the lumped coils.

I don't foresee a mad rush by the bugcatcher users to
convert to ham sticks any time soon. :/

>Since a helical monopole is 90 degrees long at the design frequency,..

It may have ~ zero reactance, as does a linear ~ 90-degree monopole, but
the helix will not have the radiation resistance of the linear version, as
John Kraus pointed out in the linked page.

Radiation resistance is a function of the end-end length of the helix and
the frequency, whether the helix is self-resonant or not. The radiation

resistance of the resonant helix in Kraus' example is much lower than that
of a series-fed, 1/4-wave, linear monopole.

Hello Wim,

So you confirm that in plasma is the same as in metal.

But what with the space. The AM should be better than FM to communicate with
the Mars.
Is/were FM used for long distances?

Were done the proper experiments in the early years of radio?

> Where is the coil on the linear monopole? Seems to be a flawed
> example to me. The helical example is loaded, but the linear is not?

Regardless of the loss in a loading coil for the linear monopole (and actually the helix would need one also), the salient point here is that even though the conductor in the helix is 3.14 X longer than in the monopole, the radiation resistance and pattern of the two forms for a given frequency is the same for the same end-end length -- as shown in the comparison.

It is the relation of the radiation resistance to the other resistances (mainly the matching network loss and the r-f ground terminal loss) that determines the radiation efficiency of the complete antenna system.

Some might think that the radiation resistance of the helix in this model is determined by the length of the conductor from which it is wound, but that isn't the case.

And what they tell:
"Because of the low signal-to-noise ratio, as with amateur-radio practice,
EME signals can generally only be detected using narrow-band receiving
systems. This means that the only aspect of the TV signal that could be
detected is the field scan modulation (AM vision carrier). FM broadcast
signals also feature wide frequency modulation, hence EME reception is
generally not possible. There are no published records of VHF/UHF EME
amateur radio contacts using FM." From:
http://en.wikipedia.org/wiki/TV_and_FM_DX

Could you explain it?

As power is limiting factor, a modulation scheme with coherent
detection and digital decoding will give best performance (best Eb/N0
ratio for certain BER) I think. So it is not just a question of AM or
FM/PM, but more how it is processed at the receiver.  Processing power
changed over time, so theoretically the best method may not be used
because of technical limitations.

Explain what?

You quote has absolutely nothing to do with the speed of propagation, you
babbling moron.

Yes, I thought that was the purpose of your posting. As Kraus said,
the helical has an advantage over a short straight conductor - same
radiation resistance with less reactance. The radiation resistance of
a 6" long Texas Bugcatcher coil is approximately the same as a 6"
piece of wire.

We agree on that point, Cecil.

But if, as if you posted earlier, "a helical monopole is 90 degrees long at the design frequency," are you claiming that such a short, self-resonant, normal-mode, helical monopole has the same radiation resistance and system performance as a self-resonant linear monopole of about 1/4 of a free-space wavelength (other things equal)?

And if you do, could you please explain why this approach was not adopted many decades ago for use by AM broadcast stations?

When you put a losless inductor in series, gain and radiation pattern
doesn't change, so the simulation is useful.

The helical requries less series inductance as the capacitive
component is less (-j2080 versus -2970), so you save on the inductor

loss (for the helical case).

For me, the disadvantage of the helical is the thickness and weight of
the construction.

No, not at all. The problem with all the folks who have these strange desires to debunk basic physics is this:

Things are connected.

When people come up with theorys/conspiracies or whatever that sopmething we thought we knew is so completely wrong, it is a mark of thier ignorance that they don't realize that there is more than one thing negated if they are correct. Want a different speed of radio compared to light - or rather I should say faster than C ? Better be prepared to abandon most of what we already know.

So in the end, we're left with either a remarkable ignorance, willful stupidity, a creationist agenda, or else that ever loving fun interactive game of arguing with the computer.

I have a relative in the communications business who would tell you to
throw it away.
The reason is - unless you are going to hook it up to a junk radio
-there is no reason to use a junk antenna unless the radio is of no
value to you.

Moores law tells me that it is probably past it's prime and it probably
isn't going to last very long anyways.

A friend of mine has a antenna that sounds identical to the one you are
trying to repair and the lengths on his antenna looks to be 12 inches.

I have not taken it down to physically measure it, but we are about to
move it in a month or two and if you still need the exact measurement -
I will get it for you.

I am surprised that the manufacturer didn't offer give you the
dimensions.
Diamond X50 - radial / part number 07003

> the Mars.
> Is/were FM used for long distances?

As power is limiting factor, a modulation scheme with coherent
detection and digital decoding will give best performance (best Eb/N0
ratio for certain BER) I think. So it is not just a question of AM or
FM/PM, but more how it is processed at the receiver. Processing power
changed over time, so theoretically the best method may not be used
because of technical limitations.
>

Best regards,

Wim

I am simple asking if radio people have trouble with the fact that the speed of waves are frequeny dependent.
I am interesting with the real radio waves in the real media. Here is an example Pulsars are spinning neutron stars that emit pulses at very regular intervals ranging from milliseconds to seconds. Astronomers believe that the pulses are emitted simultaneously over a wide range of frequencies. However, as observed on Earth, the components of each pulse emitted at higher radio frequencies arrive before those emitted at lower frequencies. This dispersion occurs because of the ionised component of the interstellar medium, which makes the group velocity frequency dependent

S

<nm5k@wt.net> wrote
> Where is the coil on the linear monopole?

Sorry, I forgot to address this question directly. Both radiators were base fed.

As shown at the top of that comparison page, a total of 30 ohms was included in each NEC model to account for the loss in the connection to r-f ground, and in the loading coil. That is why the maximum gain of both models is about -19.5 dBi, rather than 4.77 dBi.

> I should say faster than C ?

We have the two C. One of them is a constant in the wave equation.
The second is a speed of light. It is different in different media and the
frequency dependent. Also in space. An example Pulsars are spinning neutron
stars that emit pulses at very regular intervals ranging from milliseconds
to seconds. Astronomers believe that the pulses are emitted simultaneously
over a wide range of frequencies. However, as observed on Earth, the
components of each pulse emitted at higher radio frequencies arrive before
those emitted at lower frequencies. This dispersion occurs because of the
ionised component of the interstellar medium, which makes the group velocity
frequency dependent.

ce
> wavelength (other things equal)?

Absolutely not. I am claiming that a 1/8WL long *resonant* helical is
electrically 90 degrees long and has approximately the same radiation
resistance as a 1/8WL straight piece of wire. Radiation resistance and
linear *physical* length are correlated. Radiation resistance and
electrical length are NOT correlated. As I said previously
(concerning standing wave antennas) the feedpoint impedance is
associated with the electrical length of the antenna. Radiation is
associated with the physical length of the antenna.

Try to find document "Descanso4--Voyager_new.pdf" (very likely the
first result in google). This describes the Voyager communication
system. It is now more the 10 light hours from us (as far as I
know).

As far as I know, they don't equalize to correct for in band
dispersion (due to wave propagation). Maybe other people have better
info on this.

Best regards,

Wim

They used the "Ultrastable oscillator".
They measure the ions and electrons density in the interstellar medium. So
the band dispersion is obvious and the only remedy is the "Ultrastable
oscillator".

So AM and FM are quite opposite. It seems to me that FM is not the best for
the long distances.

It seems to me that here is a confirmation of that: ""Because of the low
signal-to-noise ratio, as with amateur-radio practice,
EME signals can generally only be detected using narrow-band receiving

systems. This means that the only aspect of the TV signal that could be detected is the field scan modulation (AM vision carrier). FM broadcast signals also feature wide frequency modulation, hence EME reception is generally not possible. There are no published records of VHF/UHF EME amateur radio contacts using FM." From:
http://en.wikipedia.org/wiki/TV_and_FM_DX

I do not understand this but guess.

Best regards,

S*

Cecil,
You frequently embed comments in your posts that I find especially
important to antenna basics.

I am starting a list of Antenna Axioms with this:

"Radiation resistance and linear *physical* length are correlated.
Radiation resistance and *electrical* length are NOT correlated. As I
said previously (concerning standing wave antennas) the feedpoint
impedance is associated with the electrical length of the antenna.
Radiation is associated with the physical length of the antenna.
--

As a student of antennas I do appreciate your stating the basic
principals in answering questions.

There are a lot of Hams who still think a short resonate dipole is
just as good as a full size dipole.

That would be true if everything was lossless. Unfortunately in the real world, a short dipole *system* almost always suffers more overall losses than a well-designed full size dipole *system*. In general, the shorter the dipole, the greater are the losses in the process of transferring energy from the source to the load. Short dipoles are indeed efficient radiators of the *energy delivered to the antenna*. The loss problems are in the energy transfer/delivery systems, not in the energy radiating system.

The reason that a high-Q center loading coil system has less loss than a 100% helical system is interesting. The impedance discontinuity at the loading-coil/whip junction yields a lossless phase shift that contributes to the electrical length of the antenna. It is a rare "something-for-nothing" gift from the Antenna Gods. :)

> Is/were FM used for long distances?
>

Today, phase modulation (BPSK, QPSK) is used for space. The primary driver for this is the desire for a constant envelope modulation that works with a saturated amplifier, for DC power efficiency reasons. It's also the best way to send information with a limit on peak power (i.e. the peak/average ratio is 1, and the SNR is constant)

BPSK with a non-180 degree phase shift (i.e. the carrier isn't totally suppressed) is used to allow acquiring and tracking the carrier in a low SNR environment. The carrier is tracked with a <1Hz BW tracking loop, and used to generate the return signal from the spacecraft in a coherent way. At X-band, the transmitted frequency is 880/749 times the received frequency. That carrier tracking and precise phase measurement is used to do accurate ranging and doppler measurements, which is how we know where the spacecraft is and make science measurements (e.g. precise orbit determination lets you infer the internal structure of the body about which you are orbiting, propagation measurements let you measure the properties of interplanetary space or the atmosphere of the body when you go into occultation, etc.)

recognize that deep space communications is probably one of the areas where modern technology gets closest to the Shannon-Hartley limit in low SNR environments. We may not be doing so hot in the bps/Hz high SNR area (where 64 QAM and similar things are popular), but in the "make it work on the ragged edge of detectability" we do pretty well.

No, they are not because the speed of electromagnetic waves is NOT frequeny dependent, the speed is media dependent, you babbling, ignorant, trolling, moron.

The DESCANSO web site (http://descanso.jpl.nasa.gov/) has a variety of
reports and books available for online/download/free use that discuss
a lot of this stuff. Pretty much all the missions JPL has done in the
past few decades have a "design and performance" report out there that
describes the radio system and how it works. The monograph series has
a bunch of books on some general aspect (like large antennas or
autonomous radios).

the IPN progress reports (which has had various names over the years)
is more a peer reviewed journal of record for various work in space
communication, and all of it is freely downloadable, too.

No compensation is made for dispersion.. the bandwidth of the signal
is so narrow compared to the carrier frequency that dispersion in
propagation isn't a factor. The bumps in the group delay
characteristics of the radio components are orders of magnitude
greater. To minimize that, we tend to use designs that keep the
signal in the nominal center of the IF passband.

Where dispersion becomes interesting (and is actually measured) is
when comparing signals at two separated frequencies, e.g. 8.4 GHz and
32 GHz. Or, for a closer to earth example, L1 & L2 for GPS (separated
by a couple hundred MHz at 1500 MHz) allow for compensation for
ionospheric delays.

Sorry, I don't see the link between "ultrastable oscillator" and
dispersion. Good oscillators in both transmitting and receiving
equipment are required to get the lowest possible Eb/No for your
digital modulation scheme.

Low bit rates, result in low required power, so it is true that with the advent of low bitrate digital schemes, EME is within the reach of more radio amateurs. As these modes use narrow bandwidth, dispersion effects are negligible when looking to the demodulation of the received signal (as far as I know). Even amateurs using satellite communication with analog voice, don't have to modify their demodulators.

The USO has nothing to do with the dispersion. It's just something
that lets you make the measurement, because you can integrate over
100s of seconds, and know that the signal being transmitted didn't
change (much) during that time, so any changes are due to the
propagation.

I don't know that I'd use a wikipedia article as my primary reference on this particular topic.

The reason hams don't do EME FM or EME TV is more a matter of link budgets than propagation characteristics. amateurs are limited in the maximum output power (e.g. 1500W PEP in the U.S.), and particularly if they're using amateur antennas (no 300m dish at Arecibo), you don't have enough radiated power density to send a wideband signal and have it arrive back at earth with decent SNR. So, hams use narrow band transmissions and narrow band receivers (so that they get the minimum noise power in the detection bandwidth). (also, there's a cultural thing.. the hams that are interested in TV aren't the same hams interested in moonbounce, so there's not necessarily and motivation to even try what would be a fairly difficult and expensive stunt)

If you're not limited by amateur budgets or regulatory power limits, there's no reason you couldn't send FM or TV to the moon and back. Apollo used FM in their Unified S-band system (granted, one way from the moon, not a moonbounce). I haven't run the numbers, but maybe if you had a big enough transmitter, and used something like Arecibo, you could do moonbounce tv.

We send several MHz bandwidth back from Mars with a 100W transmitter, a 3 meter dish, and receive it with a 34 meter dish on earth at greater than 0dB SNR.

A big advantage of AM is that it has simple and cheap transmitters (a modulated amplifier) and receivers (a diode). If you're spending billions of dollars to send a probe to Mars, saving (relatively) small amounts on the radio isn't worth it, especially if you have to spend large amounts more on solar panels to get the additional DC power needed.

That said, for short range links in space, FM, FSK, and AM are considered as viable alternatives, especially where you are looking for very small, very low mass. The Muses CN rover (which was about the size of a pack of cards and was going to drive around an asteroid's surface) was proposed to use a FSK data link, as I recall. AM for astronaut backup voice comm is also a possibility.

Are you looking for a comparison between the antennas? For most horizontally polarized low/medium gain antennas (which those are), the vertical (elevation) pattern is going to be almost entirely determined by the height above ground (so there won't be much difference)..

There is a formula (which I can't recall off the top of my head) which would give you the elevation angle of maximum gain for a given

height. You might want to invest in a copy of the ARRL Antenna Book,
which includes a program called HFTA which does the calculations and
lets you do a lot of cut and try.

Thanks for the link.  Very nice, concise.  Actually wasted some paper on it.

And I doubt sb has a hint of a clue concerning it.  He'll probably think
it supports his twisted view of things.

I used to think he was a troll.  I am now convinced that I was incorrect
and that the ad hominum attacks are probably deserved.  Sometimes they
are the correct approach and produce results.  See politics (both sides)
and national news (all) for examples.

Roemer's method is the one way measurement. See:
http://www.mathpages.com/home/kmath203/kmath203.htm

We know where Jovian is so the one way measurement is possible. With
spacecraft it is impossible.
Lately the one way is possible with the Mars. But independently for radio
waves and light. Mars has the satellite and radio transmitter.

In next your post is Table 1 and Fig 2. There are electrons density and
temperature. Speed of waves is temperature dependent.

Roemer's method is able to measure the speed of light in different region of
Solar system. Before me Maxwell was interested in this: "Incidentally,
Maxwell once suggested that Roemer's method could be used to test for the
isotropy of light speed, i.e., to test whether the speed of light is the
same in all directions. Roemer's method can be regarded as a means of

measuring the speed of light in the direction from Jupiter to the Earth.
Jupiter has an orbital period of about 12 years, so if we use Roemer's
method to evaluate the speed of light several times over a 12 year period,
we will be evaluating the speed in all possible directions (in the plane of
the ecliptic). "

It is interesting that Roemer has measured 220 000 km/s.

Velocity is delta-length divided by delta-time. The length of a meter depends upon the velocity and orientation of the meter stick. The length of a second depends upon the velocity of the clock. Are we sure that the velocity of light is a *universal* constant or is it just a conceptual stake in the ground to try to keep everything in the universe from being relative to something else?

From the same data Newton calculated  310 000 km/s. But it was for the Earth
the Sun (the hottest region).
Roemer's method measures speeds of light in different regions of the Solar
System.

Cecil wrote: "Are we sure that the velocity of light is a ".

"c" is the *universal* constant in EM (calculating factors between different
units).

"velocity of light" is the medium and temperature dependent.

not true. We do one way measurements from spacecraft all the time. A
high quality oscillator (aka USO)is used to generate a set of phase
coherent signals at different frequencies.

Look at PN ranging or Sequential Ranging.

> Lately the one way is possible with the Mars. But independently for radio

As do Jupiter, Saturn, and outer planets

> or Elsie gives you and it doesn't perform like you think it should,
> don't be too quick to blame the program!

My experience is basically...

-- The behavior as-built will almost always be at lower frequencies than what you designed for, due to the stray capacitances and inductances the simple filters don't take into consideration. Similarly, bandpass filters will usually end up narrower than you intended.
-- For bandpass filters, it seems just about as common that coupling between elements, approaching self-resonant frequencies, and parasitics can help just as often as they can hurt insofar as shape factor goes.
-- Taking a scrap piece of PCB material (or some other thin metal sheet-type material) and placing it midway between pairs of inductors can give you some qualitative idea as to how much coupling there is. (...and normally you want to place consecutive inductors at right angles to one another... or perhaps try the "magic" 54.7 degree angle like the old neutrodyne receivers used...)

If you need quite sophisticated filter designs, Nuhertz (aka, Jeff Kahler, Inc. -- a man who can probably quote large portions of Zverev's book...) has their Filter Solutions program, which is quite good... although only a very basic version of it is free (apparently Jeff wants to eat every now and again, and not just at Taco Bell).

Another day in antenna hell. This time, I needed a 440Mhz antenna for
a temporary repeater installation. My last remaining antenna a rather
broken Diamond X50a. The previous owner leaned the antenna against a
wall, and then backed his car into it, breaking the fiberglass radome
and bending the guts. I managed to unmangle the antenna and epoxy the
radome, but somewhere in the shuffle, the ground radials disappeared.
Duz anyone have an X50a handy that can measure the length of the
ground radials (from the aluminum base casting to the end)? The
current random length welding rods (with toothpicks jammed into the
holes) are not going to last.

```

> But the Mars is the best. Are available data for the Mars?

I don't know why Mars would be the best..

But you might start with googling "ranging Mars radiometric" or
something like that.
Or the usual tracking down the papers thing starting with one that talks
about it, and will have references.
http://seismo.berkeley.edu/~manga/folkner.pdf might give a start.
One of the footnotes mentions Viking data at S-band.

Journal of Geophysical Research (aka JGR) is where a lot of this seems
to show up.

You could search for works by authors who do this kind of thing, too.
Folkner, Asmar, Oudrhiri, Iess, Armstrong are all worth searching for.
I'd do a search for the author name AND "ranging"

For more "raw data" try the NASA Planetary Data System archive
http://pds.nasa.gov/

You're going to be on your own to find the relevant data files. Try
"radio science" as a search term.

Probably is possible to measure the optic signal from the Mars satellite. If
yes, we have the direct comparison light - radio waves.
Radio transmitter can be installed only on the Mars.
>

For me will be enough your steatment if speed of light and radio waves were
measured in different regions of the Solar System.
Katz: http://ipnpr.jpl.nasa.gov/progress_report/42-65/65I.PDF
wrote that the electron temperatures are from 10^4 to 10^6. Look at Fig 2.
Place the Mars instead a spacecraft. Between (a) and (c) should be some
differences.

You wrote: " NASA knows the results. Are they published? Of course, they're
published. Widely."

What the conclusion are?
I do not need the quantitative data.

I'm sorry to say that working for a living gets in the way, of my important to me work :-)
Add to that a few household projects, such as building a fence around one side of the house,
and some other minor repairs, I haven't had much time.
I'm still on a quest for a high Q inductor of about 240uh. I hope to hit 2000. That involves
building a new polystyrene frame and two or three bundles of 660/46 litz wire.
I still want to finish the high input impedance amp I had questions about. I have three PCB's
with the basic amp so one will be with a 0,3pf input cap to 20 Meg and a fet gate. Another
will be a bootstraped input which as I understand, should be better. The third is unknown,
If I get the bootstrap working well, I may finish the third and try to sell it on a crystal radio group.
Summer is the busy time for my business, so I won't get much important work :-) done for a while.

I have a flag antenna up in my yard.
http://i395.photobucket.com/albums/pp37/Qmavam/P1010128-1.jpg

(Basic Flag antenna info, if your not aware,
http://www.hard-core-dx.com/nordicdx/antenna/loop/flag/index.html)

When I built the antenna, the idea was fairly new and I figured there would be some changes to the design,
with that in mind I built it so I could tilt the crossbeam for easy access to the matching transformer and
termination resistor. This assembly allows me to tilt the crossbeam.
http://i395.photobucket.com/albums/pp37/Qmavam/P1010135.jpg
By pulling on a rope, the pin slides and allows the tilt.
The mast is also on a rotor.
http://i395.photobucket.com/albums/pp37/Qmavam/P1010129.jpg

There have been a few improvements, such as the Waller,
http://www.n4is.com/waller/BIG_DUAL_LOOP.html

But I have made any changes to mine.
Time to get to work.
Later, Mike
PS. have ya seen my electric gokart? :-)

I don't think that there is any way to "see" a satellite at Mars.
Perhaps if one did some sort of Moon/mars occultation?

There are precision transmitters suitable for this kind of measurement
at many places in the Solar System.

I'll assert that propagation through interplanetary space is moderately
well understood and matches all modern models of electromagnetic behavior.

Are you asking if the calculations in Katz's paper for the two paths
have been experimentally verified? I don't know..
Certainly he predicts that the temporal dispersion is going to be <0.1ps
for near IR, which is, shall we say, challenging to measure.

I'm glad Joel said "almost always." Be aware that shielding a
solenoid coil will drop its inductance (and its Qu), and thus raise
the resonance. So if you've designed a filter for a frequency well
below the self-resonances of the coils, and measure the coil
inductances without shielding, you may well find that the resonances
are higher than you expect when you put the resonators into shields.

Further to what Joel said: at least in Spice, you can add whatever
parasitic elements you want, and that can be valuable to understanding
why your real filter isn't behaving like the simple model said it
should. Recent versions of Elsie include the ability to write an
LTSpice output that opens into a nice schematic in the LTSpice
program, and lets you then play with modifying coil Q and adding
parasitic elements (including inductor-to-inductor coupling) to your
heart's content.

I agree that the NuHertz filter design software is very good, if
you're willing to pay for the full version. You can also get very
good filter design help in Agilent's ADS software, but they you'd
really have to live on rice and peanut butter for a looonnngg
time. ;-)

Cheers,
Tom

That's understandable. Well, you can look forward to retirement, then.

>   I'm still on a quest for a high Q inductor of about 240uh. I hope to hit

I'm interested in not only whether you achieve your goal, but your
trials and tribulations along the way. Please keep us informed as your
time permits.

>   I still want to finish the high input impedance amp I had questions
> about. I have three PCB's

I'm also very interested in the amp as an aid to achieving your goal.
For some reason, I'm a bit leery about it. However, your progressive
story might change that.

Is that a metal mast and how close is the bottom antenna wire? It looks
as if the antenna wire is insulated. Yes?

> When I built the antenna, the idea was fairly new and I figured there would

Interesting. You seem to be good at mechanical stuff. I am lousy.

No. Aren't all go carts electric?

Cheers,
John

measuring things to tenths of a picosecond, repeatably, can be tricky.. That's like measuring the phase difference between two 10 GHz signals to 0.3 degrees. Or, another way to look at it is 1 picolightsecond is about a third of a millimeter.

You're looking at
a) figuring out how to generate two signals at near IR that has a frequency offset that can be accurately controlled. Probably some sort of heterodyne mixing scheme would be easiest.
b) sending those two signals over the optical path through interplanetary space.
c) recovering the signals, measuring the propagation time variation (say, by looking at the phase difference between the modulation signals), and then removing atmospheric effects.
d) it's probably going to be a pretty weak signal, so you'll need to average. That means your measurement system has to be picosecond stable over the averaging interval.

None of those steps are particularly simple or easy.

I've worked on systems to measure the (microwave) distance to Jupiter and back with an accuracy of around 1 part in 1E15 at 32 GHz, integrating over 1000 seconds. That's tenths of a picosecond out of 1000 seconds. It's challenging.

Yes, the mast is metal, and the wire is insulated. At the
present time I have
450 ohm ladder line running around the frame as the antenna. I
used that because
I had a thought about some type of phasing between the two
wires, but I have not
done anything further.

   Here's a video, that's about 2 years old. I have since put new deep cycle batteries on it.
 It has a lot of torque, the kids love to do donuts, ok, I do too!
 I smoked the first motor after a year or year and a half. Actually the motor was ok, but
a connection between one 4 gauge wire and eight 16 gauge wires overheated and created
a lot of smoke. I had a second motor, so I made another motor mount and put it on.
  This started as a project to get my 16 yr old son to build something instead of play video games.
It was more my project than his, but I had some time with him and he learned a little, so I'm glad
I did it. He is too.

That's great, Mike.

I hope you have considered the safety aspects of a broken batter in a
collision.

Probably.

Cheers,
John

They were verified because there is a radio transmitter on the Mars. We do
not know the results.

  Yes, it is a concern, I have thought about a cowling to go over the batteries,
but so much to do so little time. Retirement 6 long years away, (note to self,
eat right and exercise so you'll still be healthy in retirement) :-)

Gotcha.

When you mentioned go cart earlier, I was thinking golf cart. That's why I thought they were all electric. Now that I have my head on straight, I see that your go cart is an impressive little machine.

Good work.

John

This will outperform the trap vertical at least on lower bands:
http://www.g7fek.co.uk/software/G7FEK%20antenna.pdf

It is an inverted L / vertical and needs radials or counterpoise

>   That's like measuring the phase difference between two 10 GHz signals
>to 0.3 degrees. Or, another way to look at it is 1 picolightsecond is
>about a third of a millimeter.

A third of a millimeter is no big deal and for an optical (or
sub-optical) signal - trivial. Perhaps, when stated in terms of two
10 GHz signals, "near IR" is being vastly over stated.

>You're looking at
>a) figuring out how to generate two signals at near IR that has a
>frequency offset that can be accurately controlled.

Controlled? This is dreaming in technicolor (or near IR color) if the
source is celestial.

I thought the discussion was about dispersion, the characteristic of
the medium, not sources.

>Probably some sort
>of heterodyne mixing scheme would be easiest.

Heterodyning is extremely commonplace and accurate - why would it be pondered as an alternative method?

>b) sending those two signals over the optical path through
>interplanetary space.

This blurs my understanding of celestial where two signals is a poverty of what is available from ANY celestial source.

>c) recovering the signals,

If there is a problem of recovery, it seems it is more a practical matter of source selection. Given the billions of celestial sources available, I don't understand the problem.

>measuring the propagation time variation
>(say, by looking at the phase difference between the modulation
>signals), and then removing atmospheric effects.

Why worry about the atmosphere when you can get above it?

>d) it's probably going to be a pretty weak signal, so you'll need to
>average. That means your measurement system has to be picosecond stable
>over the averaging interval.

OK, so I am lost. This laundry list of difficulties seems to be prepared to anticipate failure.

Name the near IR source and defend its choice in light (no pun) of these intractable difficulties.

>None of those steps are particularly simple or easy.
>
>I've worked on systems to measure the (microwave) distance to Jupiter
>and back with an accuracy of around 1 part in 1E15 at 32 GHz,

32 GHz is what photonics would call far-far IR at roughly 3 to 4 orders of magnitude distant from "near IR."

>integrating over 1000 seconds. That's tenths of a picosecond out of 1000
>seconds. It's challenging.

No doubt - like trying to push a peanut up Pike's Peak with your nose. That too has been done with challenge in mind.

How did this slip from "near IR" to 32 GHz?

Wow, I have never seen this antenna before, it looks pretty easy to make.

On 3/18/2011 1:16 PM, Richard Clark wrote:

> How did this slip from "near IR" to 32 GHz?

Hello Richard!

I'm back, and I see the old neighborhood hasn't changed much, although I haven't seen anything from Art - hopefully the chap hasn't had a bed turn.

Here is a question or two for those who have some doubt as to the speed of light.

A probe recently inserted itself into orbit around Mercury. How does some presumed superluminal velocity affect the insertion?

The idea that "we" have a transmitter on Mars notwithstanding, Jupiter has been transmitting RF for a long time. There are enough other spacecraft running around in our solar system, and certainly if radio waves traveled at some other velocity than what we thought they did, it would mean a strange and useless conspiracy to hide that fact.

Cue up the twilight zone music and grab your aluminum foil hats everyone.

Not we but you.

>it  would mean a strange and useless conspiracy to hide that fact.

Somebody wrote that the data from the Mars are available. But it is not easy
to find them.

Since data from Mars is less than 150 years ago I doubt you would read it
and I know you wouldn't understand it if you did.

Hello Mike,

Welcome back to the Land of Odds.

>The idea that "we" have a transmitter on Mars notwithstanding, Jupiter
>has been transmitting RF for a long time.

Jupiter was one of my first DX goals back in the early 60s. However, to expand upon your offering (I was wondering when anyone would mention these sources), Earth, too, is a natural RF source (to distinguish from the unnatural - such as stations carrying Fox Noise).

Quoting Wikipedia on Jupiter (nothing much said of the other planets other than Earth):
"The intensity of Jovian radio emissions usually varies smoothly with time; however, Jupiter periodically emits short and powerful bursts (S bursts), which can outshine all other components. The total emitted power of the DAM component is about 100 GW, while the power of all other HOM/KOM components is about 10 GW. In comparison, the total power of Earth's radio emissions is about 0.1 GW."

("emissions in the range 3 to 40 MHz are referred to as the decametric radiation or DAM")

This decametric radiation would put us (returning to my quoted question above) another several orders of magnitude beneath "near IR" and into the "frigid IR" (a distinct irony with temperatures hovering in the hundredths of a degree K).

I was palnning on building a 2M Yagi this weekend and was wondering if
my available bill of materials would have a significant effect on
normal design parameters. The plan is to use 3/4 inch EMT conduit for
the boom and 3/8 inch all-thread for the elements. My concern was that
the threads could change the design frequency.

Hello Jimmie,

I think it will be OK, but if you want to be 100% sure, make a dipole of same thickness tubing and one from the threaded material of choice. If results are same, you can use it without dimension scaling. Are you using galvanized or alu material?

If required, apply some corrosion protection.

With kind regards,

Wim

The reference to 10 GHz was to try and relate the problem at Near IR
to something more familiar (since I suspect that most r.r.a.a are more
familiar with RF than light) (since speed of *light* was being
discussed, and the reference cited referred to optical communications
at Near IR)

>
> >You're looking at

The figures in the referenced paper showed a manmade source,
presumably with some sort of source which could be designed to make
measuring dispersion easier.

>
> I thought the discussion was about dispersion, the characteristic of
> the medium, not sources.

Precisely.. but if you're going to measure dispersion, you've got to
have a way to do it, and sending out two signals that are coherent
with each other at a known offset seems to be a fairly straightforward
approach.

>
> >Probably some sort
> >of heterodyne mixing scheme would be easiest.

>
> Heterodyning is extremely commonplace and accurate - why would it be
> pondered as an alternative method?

For optical signals, there could be other ways to generate multiple
signals at different frequencies that are coherent with each other. I
don't know enough about optical measurement techniques. I *do* know
that you can modulate near IR with RF signals using a variety of
techniques.

>
> >b) sending those two signals over the optical path through

Back to the figure reference.
And, of course, getting coherent signals from a celestial source might
be a challenge. I don't know.. maybe some sort of clever correlation
technique in an interferometer would do. Not really my field.
> >c) recovering the signals,
>

Precision detection of a man made signal from across the solar system
is a challenge.

>
> >measuring the propagation time variation

> >signals), and then removing atmospheric effects.
>
> Why worry about the atmosphere when you can get above it?

Indeed. That would make things easier, and is something that people
want to do. But so far, we're stuck with just sending the transmitter
out there.

>
> >d) it's probably going to be a pretty weak signal, so you'll need to

> prepared to anticipate failure.

Not so much failure, but that the original question asked for experimental data to confirm a fairly well understood effect. My point is to show that collecting that experimental data is non-trivial, and not something that you can just rig up in your backyard with baling wire and sealing wax.

>
> Name the near IR source and defend its choice in light (no pun) of

There has been more than one optical comm experiment from deep space.

Well.. yes, it *is* hard, but if you want to know the internal structure of another planet, it does take some work.

>
> How did this slip from "near IR" to 32 GHz?
>

The example of 32 GHz is to illustrate that I am not just speculating about the difficulties of doing it at IR. I have personal knowledge of how hard it is at 32GHz, and I'm pretty sure it's harder at Near IR.

So someone on a listserv or usenet group who's looking for a "hey I did the experiment yesterday, and sure enough, dispersive media have dispersion" isn't going to get it. Nor are they likely to find the results of someone who might have done it for real without digging a bit.

It would be difficult to make measurements of dispersive propagation
```

in the interplanetary media using the natural emissions of Jupiter, since you don't have knowledge of the relative phases/timing of the emissions at different frequencies, so you have nothing to compare against on earth.

If you had two receivers in space separated by some distance along a line from Jupiter, maybe you could do it. If they're on earth, I think the ionospheric variation would dominate your measurement.

That said, at least you can get a big frequency ratio so the 1/f1^2-1/f2^2 term would be large.

Maybe the folks building LOFAR have some clever ideas on compensating for the ionosphere and they will be able to use Jupiter as a source for this sort of measurement (if they're interested.... I suspect they're not..)

```

wind seems to have stopped. I raised my hand forward, human Vientiane, all is nothingness. Robber looked at me and said: =93girl, good death is better than live. According to my right.=94 I am desperate to see him, look at the cliff, sad: =93The father and mother, Lijun went. Some brother , afterlife again later. =93finish, I wiped tears jump into the abyss. Robbers rushed Yaqian looked down, shook his head, got up to go back. Huangfu Shaohua lead a horse walking in the mountain, the ear seems to call the sound came, Mangxiang around and said: =93You hear me.=94 Guards shook his head blankly, is it an illusion. Shaohua doubt his ears heard only the whistling of the wind. =93Son, but also to move forward Why.=94 Bodyguard Pocket Watches Road. Huangfu Shaohua was about to answer, when suddenly a pain in the chest, tears almost fell off. Filled with an ominous feeling in his body. He no longer answer, flew up to display their footwork, guards hurriedly behind him. Huangfu Shaohua walked in front of an open place.

By torch and saw footprints on the ground there are many messy, busy look down. A bodyguard to catch up, pick up something from the floor: =93The son, see.=94 Huangfu Shaohua a closer look, but it is a kit, his mind a cool, busy out a look inside things, it really is that Sansei stone blocks, above marriage there is a vague word. =93Lijun.=94 Huangfu Shaohua whinny cried: no response, the valley was quiet. =93Where are you, Lijun, you quickly to answer me.=94 Huangfu Shaohua shouted aloud. His throat, the tears start coming out. Guards in the next advised: =93The son, you have to calm, under the watch of these footprints, which should be the robber was, arrived at their cottage to go up, too late, I=92m afraid the girl =85 Bangladesh =85=94 Huangfu Shaohua heard this, jum=p immediately launched, to kick about Mafu, horses negative pain, quickly run to. Disorder along the footsteps of the ground, and soon to the cottage. Huangfu Shaohua took the lead and ran inside, engine out of the sword, while slashing indiscriminate killing, down a robber at once, screams again and again. Chieftain from the inside out, iron bar in his hand, asked: =93Who you are, why attack my cottage.=94 Huangfu Shaohua not answer, pounced opinions on thorns. They have dozens of back and forth strokes, Shaohua Mu behind the ear guards are around Chikae GHD Deluxe Midnight iron, one extraordinary skill, such as instant put Zhaizhong kill the rest were obliterated, chieftain met not help flustered up,http://cheapusas.noxblog.com/

Hi Jim,

We would first have to agree what "dispersion" means.

If it conforms to optical dispersion (this having started, at least
for me, in the near IR, which is optical as far as I am concerned),
then the wide bandwidth (offering us with many time coherent sources)
through a frequency dependent media would present different phase
shifts which could then be cross-correlated.  Modal dispersion might
present a problem because even though Jupiter is far away, it still
presents a significant arc of span across space (i.e. not even close
to being a point source).

Hi Jim,

The display and measure of Newton's rings is exceedingly trivial for
optical time/phase/freq/distance differences far shorter in shift (nm
to um) than what is being described here (in mm).

Galvanized, The pupose was to demostrate that materials can often be
adlib and still have a useable antenna. Maybe this one will not last
30 years before it corrodes away but probably 5 or 6. Also I want to
demonstrate the value of using a jig when building many antennas all
made the same. I have tried the test you mention on 10 meters before
replacing a vertical mounted on my truck. Changing materials didn't
seem to make much difference. WIll try the same for 2M but I dont
have an SWR meter for 2M at this time.. Was hopng someone in the group
might think this interesing enough to try.

Jimmie

I made a j-pole from galvanized steel. It worked beautifully. When I
replaced it with a commercial antenna I notice very little change in
performance and signal strength. I had hoped my kluge was deficient in
performance compared to the commercial antenna. Didn't seem so. My QTH
was way out in the country side about 20 miles from the nearest repeater.

Just a story for you, no hard data. Sorry.

John

Unless you can tell the differance in a few tenths of a dB, almost any
conductive material will work for simple antennas if the diameter is large
in terms of a wavelength. If the antenna is built the same or vary similar
to a comercial antenna, you usually don't notice any differance.

Lots of money is spent on the comercial stuff for little or no improvement.
Problem for many is buying the materials. If you only need a small ammount
of material , you often have to buy a lot.
Then not everyone has the machinery to do the building.

Hello Jimmie

Zinc has about 60% conductivity of alu alloys that are used for
antennas, so the surface resistance will be almost 80% of alu tubing
(same diameter). Of course you have thread that increases the path
length. Given the thread, your net conductivity will be about 40%
(w.r.t. alu).

This will be OK for doing your experiments and to demonstrate that you
can use many materials for antennas. I would recommend you to find
some means to determine VSWR (or refl. coeff.) at 2m (home made
slotted coaxial line, or home brew coupler?).

With kind regards,

Wim

Of course. My response is aimed at the OP's subject line. I'm trying to
be encouraging.

> Lots of money is spent on the comercial stuff for little or no improvement.
> Problem for many is buying the materials.  If you only need a small ammount
> of material , you often have to buy a lot.
> Then not everyone has the machinery to do the building.

I bought a long piece of chain link fence top rail for the mast and a
piece of conduit for the 1/4 wave element. I used a hacksaw and a drill
to do the machining. I used automobile hose clamps to connect the
transmission line to the kluge. It worked well for about 10 years until
high winds bent the mast (chain link fence top rail is not that stiff).

<no

No for your (Heavisde's) paper waves.
My waves are Tesla's waves: http://www.tfcbooks.com/tesla/1929-09-22.htm

Tesla say in 1929: " The effects, according to my view, were due to minute
particles of matter carrying enormous electrical charges, which, for want of

a better name, I designated as matter not further decomposable.
Subsequently those particles were called electrons."

The same wrote Faraday in 1846: http://www.padrak.com/ine/FARADAY1.html

I assume that the two greatest man are right.

Electrons are produced by the Sun (rare plasma +dust). They rotate with the
Sun and their temperature is place dependent. Speed of the pressure waves
must be also the place and frequency dependent.

But you do not care about that . You are fine with the EM waves. Are you?

> There is no space. It is packed with compressed aether.

No aether as "a medium filling all space, called the ether, which was
structureless, of inconceivable tenuity and yet solid and possessed of
rigidity incomparably greater than that of the hardest steel" (Tesla).

Space is filled with the ISM (rare plasma +dust). ISM is produced by stars
and rotate with them. So radio waves are the electron waves. Acoustic waves
are ions waves.

My experience with the Hustler 4BTV hasn't been good. Over two hamfest
I bought 4 of them, lucky for me I was only buying then for the tubing
and mount and paid around $10 each for them. I dont think any of them
had a trap that wasnt bad.

in vacuum, of course, there is no dependency on wavelength.

in a dispersive medium, there is a dependency on wavelength. A good practical example of a dispersive medium for radio is the ionosphere.

interplanetary space also is very slightly dispersive (due to the small, but non-zero, ion content)

Inasmuch as temperature and ionization are related, I suppose there's a relation, but nothing like you see with sound, where there's a very strong relationship between propagation velocity and temperature (but that's because the mechanism of sound propagation is molecules/atoms colliding with each other)

Hello Chris,

From another thread I concluded you have a flat membrane roof.

If you plan to use the 80/75m antenna for NVIS (local traffic) mostly, why not putting a horizontal dipole above your roof. It will be very likely below resonance length, but you can match this to 50 Ohms. This will almost certainly result in better efficiency w.r.t. the commercial vertical. For 40m and below, you can go vertical.

If you like to experiment and know the problems w.r.t. RF high voltage, you may try a vertical resonating antenna that is in half wave resonance. You will get end-fed voltages in the kV range, but the common mode current will be significantly less w.r.t. a quarter wave resonating structure. This reduces the requirements for your ground provision and the ground loss.

What is the height of the tree that you plan to use as support (in other words what is the maximum vertical height you can use)?

With kind regards,

Wim

If you put an autotuner at the base of a 1/4 wave 10m vertical (i.e. 2.5m long), and some random length radials, for 10,12,15,17, and 20, it will work fairly well.

The feedpoint impedance of a half length antenna (i.e. 1/8 wavelength vertical) isn't so horribly different that losses will bite you. (for comparison.. I ran some models a while ago for a 20-odd foot vertical. resonant (Z=39 ohms) at 9.4 MHz, and at 4.7 MHz, the z was 14-271j. I just happened to have that data handy.. you're looking at a shorter antenna and higher frequencies, but the ratios are likely to be similar.

W9CF's tuner calculator says a T network for the first case (Z=39 at 9.4MHz) would have 0.1 dB loss (3%), and for the second case, you'd have 1.7dB loss (33%)

While it's not great to burn a third of your power in tuner/feedline losses, on the other hand, it's also not horrible.

If you can put up something that's around 3-4 meters (10-13 feet) long, that will work even better. A piece of plastic pipe with some 12gauge wire inside it, for instance. or a 10 foot length of thinwall 1/2" conduit (sure, it's steel, but it's also got pretty good surface area.. without actually doing the calculation, it's probably comparable to a 12AWG wire in resistance)

Anyone have a design for band pass filters?

TIA

Cheers
Richard

Well that's a nice bit of trivia you bring up, but that was not the
correct date, and not even the correct decade.

So why did you bring it up?

 > But I am steel loking for the evidences that the speed of radio waves is
 > temperature and wave lenght dependant.
 > S*

You won't see it except when it's not in vacuum and then it's very
difficult for people like you to detect it.  You actually have to do
something.

Lots of people and lots of different design calculators on the web.

What kind of band pass filter did you have in mind audio, RF, LC, crystal, cavity, strip line?

Hi Folks,

I've been blogging about our new life here in Costa Rica for the past couple of years at ' http://adullroar.blogspot.com' (http://adullroar.blogspot.com) and just started up another one that is solely about my ham radio hobby. Quite a few changes to the setup that I had in Oregon, though I was able to bring down my 2 elt. 5-band quad, though I had to leave behind the boatanchor gear. :p

I'm into CW and PSK31, have a couple of K2s, a KX1, and a Ten Tec Scout that is somewhere in a box still. My QSL manager is W6WU.

Anyway, stop by at http://cloud-warmer.blogspot.com where I will probably being writing a lot about my favorite part of the hobby, wire antennas!

I just finished modeling a 2 elt. rotatable EDZ for 10 meters that shows over 13 dBi and over 12 dB F/B! I hope to have it in operation in a month or two. You can download the .nec file at the blog.

73 es pura vida,

Casey, TI2/NA7U

The Tree is about 40 feet tall, and yes I do have a flat roof. I could attach a sloping wire from the tree to the roof, and center feed it with ladder line. This wire would be about 60 to 80 feet long, give and take a little. Unfortunately, it will be very visible!

There is a good Filter Design Tool at http://www.aade.com/ which you can use to design bandpass, lowpass, and highpass filters with any number of poles and configurations. It's free but it nags you until you buy their LC Meter.
The LC Meter is a good bargain and if you are going to build filters, you need to measure a lot of Ls and Cs.

If Tesla is right than the radio waves propagation is electrons colliding with each other.
Faraday was the same opinion: "I suppose we may compare together the matter of the aether and ordinary matter (as, for instance, the copper of the wire through which the electricity is conducted), and consider them as alike in their essential constitution; i.e. either as both composed of little nuclei, considered in the abstract as matter, and of force or power associated with these nuclei"

Faraday known that the speed of waves is the same in copper and space. The media must be the same. Charged particles = electrons.

Analogy sound - electric waves is full.

RF waves (fields/photons) cannot exist or flow IN copper. RF waves
(fields/photons) flow in the space surrounding copper. The free
electrons in a copper wire move only at a tiny fraction of the speed
of light, 0.00028 m/s in the Wikipedia example. For RF signals, the
electrons move hardly at all and can be considered to be vibrating in
place acting as a sort of bucket brigade for the photons.

Hello Chris,

My idea is/was to have the (short) 75/80m dipole above your roof (assuming that the roof supporting structure isn't conducting). When you put the matching components and balun function in a box on the roof, you can go down with just a coaxial cable. This will keep the VSWR within acceptable limits to allow further matching in the shack. If space/visibility permits, I would go for the ladder line as you suggested. Main disadvantage of the dipole above the roof: interference from and towards domestic equipment.

When the visibility of the dipole above the roof meets aesthetic rules by far, you may put 2 or more wires to the dipole (fan type short dipole). This reduces the reactive component, without reducing the radiation resistance, so matching becomes easier. Visibility, is this really a problem?

Given the size of the tree, 40m and below should be possible without huge investment in ground provision. For 10m the wire/tube length isn't good, unless you can add a reactance to get collinear behavior.

The above doesn=92t mean 80m isn't possible, but due to the low radiation resistance (about 5 Ohms), you need a better counterpoise / ground provision, and the NVIS performance of your vertical isn't good.

As with many things, making a choice isn't easy. A tree 60..80 feet from your house looks very attractive from an interference perspective.

With kind regards,

Wim

>> Faraday known that the speed of waves is the same in copper and space.

>RF waves (fields/photons) cannot exist or flow IN copper. RF waves (fields/photons) flow in the space surrounding copper. The free electrons in a copper wire move only at a tiny fraction of the speed of light, 0.00028 m/s in the Wikipedia example. For RF signals, the electrons move hardly at all and can be considered to be vibrating in place acting as a sort of bucket brigade for the photons.

All waves are the vibrations in place.

Faraday wrote: " The velocity of light through space is about 190,000 miles in a second; the velocity of electricity is, by the experiments of Wheatstone, shown to be as great as this, if not greater: the light is supposed to be transmitted by vibrations through an aether which is, so to speak, destitute of gravitation, but infinite in elasticity; the electricity is transmitted through a small metallic wire, and is often viewed as transmitted by vibrations also."

The electrons drift is like Stokes drift:
http://en.wikipedia.org/wiki/Stokes_drift

My first post: "" Using such a pulse pattern makes the echo, which arrives
back from the
moon 2.4 seconds later". From: http://www.rense.com/general79/haarp.htm

"During the experiment, which was carried out on Oct. 28 and 29, 2007, the
radar signals from HAARP were at 7.4075 MHz and 9.4075 MHz"

I do not know the distance to Moon on that days but for the mean distance
384 000 km the speed is:

2x384 000/2.4 = 320 000 km/s."

At that time the Moon was at perygeum so the speed was 300 000.

Speed of light in air, glass, water is temperature (mirage) and
wavelenght.dependent.

In space should be the same, but for Tesla's waves.

```

Anyone that would call me fat needs new spectacles. :/
I have been known to sweat, but only profusely when I
have to work in hot attics.

I am socially maladjusted, and actually thrive in this
state. My dad was never a ham, so I can't blame him for
being radioactive, or even a radio bully for that matter.
His idea of a hobby was cooking portions of dead animals
on a charcoal grilling device. No RF required.

I recorded the audio from the 2008/01/19 test. Did you?

What measurements did you get from it?

I am very interested.

I have reportable results. It was a perigee plus or minus your location. And I have a correction factor for the delay from the HAARP site to my location in Minnesota.

Do you know your location?

What do you have for results?

tom

It's now over four years since I used it, but I found the AADE filter
design program very good. A works colleague bought and made up the LC
meter kit, and was also pleased with it.

The Moon being full has nothing to do with it's distance from Earth or
it's radio reflectivity.

You are a babbling idiot.

Which is irrelevant being 3 days later than the HAARP test.

Quite incorrect, since perigee was 366435 km on the 19th. Your number
is way too low for what it would have been on the 22nd.

Do you ever check anything for correctness?

Longer waves travel faster in air and glass. The same is in real space. But
I do not know how much. So I am asking.

I am asking if radio waves are faster than light.
Now is possibility to measure the both between the Earth and Moon and speed
of radio waves between Mars and Earth..
For centuries is possibility to measure speed of light in space between
Jovian and Earth.

Probably the Moon is to close to the Earth to pick up the difference. Is it
enough at full correctness?

Others have mentioned AADE's program, which is good. I usually use Elsie (www.tonnesoftware.com); the free version will likely do what you need. Elsie and the AADE program are different enough that it's worth having both if you do much filter work. For simple filters, there's an ap in RFSim99, which is a worthwhile program for all the other things it covers too -- also available by free download. And of course there are plenty of web-based filter designers.

One thing to beware of is that the filter design programs won't in general tell you everything you should know about practical aspects. Some will let you put in coil Q, which is helpful, but they usually won't tell you the effects of stray coupling between inductors, or of stray capacitance. Some filters I've worked with are very tolerant of a little stray coupling, and others are extremely sensitive to it. If you build a filter according to a design that either the AADE progarm or Elsie gives you and it doesn't perform like you think it should, don't be too quick to blame the program!

If you tell us more about the goals for the filter, we might be able to give you some further hints.

Cheers,
Tom

You are incorrect. But explaining it would do no good, as you have
proven that you do not listen and can not learn.

Radio waves and light are the same thing except we call them something
different due to wavelength.

Tests of earth to moon to earth, earth to venus to earth all give the
same speed of light regardless of frequency used.

It is an obiect of interesting for ages. The first was observing of color changes of Io (Jovian's satellite). But the difference in light frequences are small.
But light and radio waves have extremally different frequences. You wrote: "Tests of earth to moon to earth, earth to venus to earth all give the
> same speed of light regardless of frequency used." Write "if radio waves
> are faster than light".

Speed of light in space is known thanks Roemer.s method. Now are radio transmitters on the Mars and is possibility to use the Roemer's method for radio waves. NASA know the results. Are thy pulished?

The speed of light and the speed of radio waves are identical, you babbling
idiot.

Light and radio waves are the same thing at different frequencies, you
droooing cretin.

If you had ever read anything written less than 100 years ago, you would
know all this was proved long ago, you gibbering moron.

In todays textbooks is wrote that speed of light is frequency dependent
(glass prism).
The same is in air (atmosphere). Why the heliosphere is different?

You can't read, you babbling moron, that is NOT what today's textbooks
say.

The speed of light is not frequency dependent, it is medium dependent,
that is it is dependent on the refractive index of the medium.

The refractive index of a medium is frequency dependent.

You haven't a clue which is the cause and which is the effect.

> The same is in air (atmosphere). Why the heliosphere is different?
> S*

Yet more meaningless, babbling, nonsense with no connection to reality.

The difference of which you speak is very small. The atmosphere is
about 0.27 % of the total distance between the earth and the moon.

0.27% of "very small" would be very, very small.

0.27% of "very small" would be very, very small.

But heliosphere reach the last planet (at least).

Yeah, and what is the density, refractive index, permeability, and
permittivity of the helioshpere, you babbling moron?

Not precisely true. Interplanetary space slightly dispersive. Emphasis
on *slightly*.

Kenelm Philip predicted a difference back in 1957

Modern estimates for electron density in interplanetary space of 1E6 to 1E10 per cubic meter.

dTau = e^2*Ne*L/(2*pi*m*c) * (1/f1^2 - 1/f2^2)

e= charge on an electron 1E-18 Coulomb
m = mass of an electron at rest (9.11E-31 kg)
c = velocity of light (3E8 m/s)
L = propagation distance
Ne = electron density (pick a number between 1E6 and 1E10)

f1 and f2 are the frequencies (in Hz) (assumed relatively closely spaced)

To bound the magnitudes.. for 1000 light year and 1 and 2 GHz, the dispersion is about 1 nanosecond.

Of course, they're published. Widely. I would check Journal of Geophysical Research or similar publications.

As a practical matter, precise measurements of the time of flight to/from a spacecraft is used to figure out where the spacecraft is and its radial velocity.

Typical range accuracy is on the order of a few meters, velocities good to a few cm/s, for something at the orbit of Neptune or Uranus.

Precise doppler measurements are used for radio science experiments, e.g. to determine the internal structure of a planet or moon by precisely measuring the orbit of a satellite. A typical performance for such a measurement is 1 part in 1E15 over 1000 seconds at 32 GHz or 8GHz.

Hmm, without getting into the ad hominem attacks here..

This kind of thing is well documented. I'd start by downloading the
"Plasma Physics Handbook" from the Naval Research Lab. It has a nice
summary of all the relevant equations and typical values.

A quick google for "interplanetary EM propagation dispersion" turns up
plenty of references.

Again, though, it's very, very small (parts in 1E12 kind of small).. but
big enough to be of interest to scientists who measure such things. It
would be the ambitious amateur who could make a measurement of the
required precision, but it is doable. Several spacecraft transmit
simultaneous tones generated from a common high quality reference.

Working out and removing the effects of the Earth's ionosphere and
atmosphere are probably the biggest challenge.

Yeah, you know that and I know that, but the babbling moron that continues
to post his mindless gibberish refererenced to something written 150 years
ago doesn't know that.

triboelectric charging can result in you being positive or negative...
and is not related to IR radiation you are emitting all the time.  lay
still flat on the ground and you will not be triboelectrically
charged, but you will be constantly radiating IR radiation.

Hi Norbert,

Demonstrable proof shows otherwise.

>About external noise sources:
>
>The loop is smaller (less surface) and therefore picks up less static noise.

Static is indistinguishable from the RF you want to hear. In other
words static is RF, signals are RF. If your small loop picks up less
of one, it picks up less of both. However, this "picks up less" is
arguable.

>The dipole covers a larger area in which there can be sources of noise.

Reread my statement: "If you erected a conventional (electric) dipole
IN THE SAME SPACE."

>The pickup loop that connects the coax to the loop antenna is isolated from

>the antenna and it forms a shortcut for DC. The signal transfer is
>inductive.

This is a tautology, not a reason.

>The magnetic loop tunes to the frequency and there is no external antenna
>tuner needed.

Here, the Q of the tuned loop DOES contribute to less interference of
out-of-band signals. It does not reduce interference to in-band
signals. Noise is not specific to frequency, although single
frequency emitters can be called noise (unwanted).

>About intenal receiver noise and mix-products:

Barring problems of lacking a choke on your control line introducing
SWR issues, I would tend to agree.

>As for receiving the readability is more important than signal strength. The
>lower RX signal from the magnetic loop is often more readable than when
>using a full size dipole at ideal height. I think that the advantages are

You have a lower signal because you have a lower antenna. Let's not
turn a deficit into a glowing recommendation - especially when you go
to transmit you lose that same gain from low height.

>For TX there are advantages of the magnetic loop over the full size dipole.
>When one has shortage of space. The high small band pass filter that the
>Magnetic Loop is, makes the radiated signal free of harmonics. Therefore
>there is a smaller chance of rfi to be expected .

A small (electric) dipole is identical in characteristics. It simply
doesn't come built with its own tuning mechanism.

Your arguments are not about antenna, but tuning.

>The 3 % efficiency is hypothetical based on the outcome of calculations
>software that is available on the Internet.

I presume this is for the MIDI loop with a 2M diameter. The claim
offered is that it exhibits a Q of 1500 at 3.5MHz. The radiation
resistance for that size of loop is 0.49 Ohm. So, if 3% of the power
goes to 0.49 Ohm, then 97% of the power must go to heating up the
large tubular structure's Ohmic resistance (which would be very high,
and quite remarkable for that mass). Let's consider that you took an
Ohmmeter and measured half an Ohm in the structure, then you would be
losing only 50%, not 97%.

If you short your Ohmmeter leads together, I bet they have less than
half an Ohm resistance, why should this massive structure have more
loss than simple wire?

The argument would also have to answer the high Q (that much loss is
very low Q).

>For example the loop calculation software of G4FGQ.

Give us the entry data and the formula.

and is not related to IR radiation you are emitting all the time.  lay
still flat on the ground and you will not be triboelectrically
charged, but you will be constantly radiating IR radiation.

Excellent thinking. If I am laying on the ground I constantly pump electrons
from the ground into the air without being charged. Exactly like your
transmitting antennas connected with the ground or chassis. Without
connection to ground they becomes positively charged.

Are you able to measure the static voltage of a human skin?

EM wave static is indistinguishable from RF waves. Pstatic, for
instance, is not caused by EM waves and is therefore, distinguishable.

In a practical situation, for instance a 20 meter long dipole over a
building picks up electro smog from the floors underneath, the loop covers a
small space and is physically further away from part of the sources.

In free space high in the sky they will pick up the same noise, I
agree.

The bandwidth is so narrow in the 40 meter band (I3VHF) that only a few kHz
so there is a smaller chance of strong out
of band signals.

By the way, having to tune the loop every time when changing frequency is a
mayor disadvantage of tuned magnetic loops. The MFJ loop can be tuned rather

fast and the larger bandwidth makes it easier to hear within several kHz from the tuned frequency.

I don't think that it's just a matter of height. But maybe you are right. I can't put up a full size verticale on my balcony to compare.

A magnetic loop will work indoor and outdoor. Low on the ground and high in the sky. And without a counterpoise. Dipoles require space. Verticals require counterpoise. When there is little space or other restrictions the loop is a nice alternative.

For transmitting a magnetic loop can be also interesting when there is no space for a full size antenna.

One could also for example use the full size antenna for TX and the magnetic loop as an
alternative for RX.

It's not that I'm against dipoles because I reviewed some magnetic loops. I appreciate the concept of the magnetic loop. I would use a dipole with open feeding line and symetric tuner where possible.

You can download the loop calculation software and enter the dimensions of
the loop. I don't provide software.
I don't know the formula.
